Most real-world spectrum analysis problems involve the computation of the real-data discrete Fourier transform (DFT), a unitary transform that maps elements  $N$  of the linear space of real-valued  $N$ -tuples,  $R$ , to elements of its complex-valued  $N$  counterpart,  $C$ , and when carried out in hardware it is conventionally achieved via a real-from-complex strategy using a complex-data version of the fast Fourier transform (FFT), the generic name given to the class of fast algorithms used for the efficient computation of the DFT. Such algorithms are typically derived by exploiting the property of symmetry, whether it exists just in the transform kernel or, in certain circumstances, in the input data and/or output data as well. In order to make effective use of a complex-data FFT, however, via the chosen real-from-complex  $N$  strategy, the input data to the DFT must first be converted from elements of  $R$  to  $N$  elements of  $C$ . The reason for choosing the computational domain of real-data problems such as  $N$  as this to be  $C$ , rather than  $R$ , is due in part to the fact that computing equipment manufacturers have invested so heavily in producing digital signal processing (DSP) devices built around the design of the complex-data fast multiplier and accumulator (MAC), an arithmetic unit ideally suited to the implementation of the complex-data radix-2 butterfly, the computational unit used by the familiar class of recursive radix-2 FFT algorithms.

Applications of Digital Image Processing VIII Creative Teaching Press  
When Speech and Audio Signal Processing published in 1999, it stood out from its competition in its breadth of coverage and its accessible, intuition-based style. This book was aimed at individual students and engineers excited about the broad span of audio processing and curious to understand the available techniques. Since then, with the advent of the iPod in 2001, the field of digital audio and music has exploded, leading to a much greater interest in the technical aspects of audio processing. This Second Edition will update and revise the original book to augment it with new material describing both the enabling technologies of digital music distribution (most significantly the MP3) and a range of exciting new research areas in automatic music content processing (such as automatic transcription, music similarity, etc.) that have emerged in the past five years, driven by the digital music revolution. New chapter topics include: Psychoacoustic Audio Coding, describing MP3 and related audio coding schemes based on psychoacoustic masking of quantization noise Music Transcription, including automatically deriving notes, beats, and chords from music signals. Music Information Retrieval, primarily focusing on audio-based genre classification, artist/style identification, and similarity estimation. Audio Source Separation, including multi-microphone beamforming, blind source separation, and the perception-inspired techniques usually referred to as Computational Auditory Scene

Analysis (CASA).

This book traces the prehistory and initial development of wavelet theory, a discipline that has had a profound impact on mathematics, physics, and engineering. Interchanges between these fields during the last fifteen years have led to a number of advances in applications such as image compression, turbulence, machine vision, radar, and earthquake prediction. This book contains the seminal papers that presented the ideas from which wavelet theory evolved, as well as those major papers that developed the theory into its current form. These papers originated in a variety of journals from different disciplines, making it difficult for the researcher to obtain a complete view of wavelet theory and its origins. Additionally, some of the most significant papers have heretofore been available only in French or German. Heil and Walnut bring together these documents in a book that allows researchers a complete view of wavelet theory's origins and development.

After more than two decades of research activity, speech recognition has begun to live up to its promise as a practical technology and interest in the field is growing dramatically. Readings in Speech Recognition provides a collection of seminal papers that have influenced or redirected the field and that illustrate the central insights that have emerged over the years. The editors provide an introduction to the field, its concerns and research problems. Subsequent chapters are devoted to the main schools of thought and design philosophies that have motivated different approaches to speech recognition system design. Each chapter includes an introduction to the papers that highlights the major insights or needs that have motivated an approach to a

problem and describes the commonalities and differences of that approach to others in the book.

This manuscript provides a blueprint for people conducting focus groups. The examples are highly useful and in combination with the book give people the information they need to actually run a focus group. . . . Chapter nine is uniquely useful for educators who frequently work with children and teachers in school settings. The concrete examples will be extremely helpful to focus group moderators. . . . The book will be useful for reference and for courses in survey research. I will recommend the book for both purposes. --Kathy Green, University of Denver "This book does a nice job of providing readers with the specific steps necessary to conduct focus groups. If a person had never heard of a ?focus group interview? before reading this book, they would have an excellent comprehension of the history, specific methods, and pitfalls of using the focus group interview methodology." --Thomas M. Archer, The Ohio State University Why use focus groups in educational and psychological research? The focus group interview is a research tool that holds great promise for application in educational and psychological research. Focus groups offer an effective way to obtain knowledge about what key stakeholders think and feel resulting in information that yields better surveys, evaluations, and research studies. Although there are numerous books and articles that address focus groups, most are directed at business and marketing. Focus Group Interviews in Education and Psychology shows the specific steps to take to conduct focus groups in educational and psychological settings. Through the use of numerous examples, the authors show readers how to prepare for a focus group, create a moderator?s guide, select a setting, and analyze the results gleaned from focus groups. In addition, they devote an entire chapter to doing focus groups with adolescents and children. Each chapter contains numerous procedural tables as well as end-of-chapter applications for performing "trial runs" of the techniques discussed. Qualitative and quantitative researchers and students in education and psychology will find this book a useful guide for refining their research instruments and for opening new vistas to understanding their subjects? responses. Focus Group Interviews in Education and Psychology is an invaluable tool that is beneficial to researchers and professionals in research methods/evaluation, psychology, education, and social work.

### **Dynamic Logic. New Trends and Applications**

Pearson Academic

This book constitutes the proceedings of the First International Workshop on Dynamic Logic, DALI 2017, held in Brasilia, Brazil, in September 2017. Both its theoretical relevance and practical potential make Dynamic Logic a topic of interest in a number of scientific venues, from wide-scope software engineering conferences to modal logic specific events. The workshop is promoted by an R&D project on dynamic logics for cyber-physical systems. The 12 full

papers presented in this volume were carefully reviewed and selected from 25 submissions. The workshop is based on the project DaLi - Dynamic logics for cyber-physical systems: towards contract based design.

EVERY art and every inquiry, and similarly every action and pursuit, is thought to aim at some good; and for this reason the good has rightly been declared to be that at which all things aim. But a certain

difference is found among ends; some are activities, others are products apart from the activities that produce them. Where there are ends apart from the actions, it is the nature of the products to be better than the activities. Now, as there are many actions, arts, and sciences, their ends also are many; the end of the medical art is health, that of shipbuilding a vessel, that of strategy victory, that of economics wealth. But where such arts fall under a single capacity- as bridle-making and the other arts concerned with the equipment of horses fall under the art of riding, and this and every military action under strategy, in the same way other arts fall under yet others- in all of these the ends of the master arts are to be preferred to all the subordinate ends; for it is for the sake of the former that the latter are pursued. It makes no difference whether the activities themselves are the ends of the actions, or something else apart from the activities, as in the case of the sciences just mentioned.
