"Mr. S. Newhouse, a member of the Oneida Community, having become widely known as the maker of an excellent kind of steel-traps, and it being generally understood that the practical perfection of his

traps is owing to the wisdom in wood-craft which he gained in early life by actual experience in trapping, he has often been applied to by his customers and others for information in regard to the best methods of capturing various animals."

INTRODUCTION 1-1.1 Purpose. This chapter provides a general history of the development of military diving operations. 1-1.2 Scope. This chapter outlines the hard work and dedication of a number of individuals who were pioneers in the development of diving technology. As with any endeavor, it is important to build on the discoveries of our predecessors and not repeat mistakes of the past. 1-1.3 Role of the U.S. Navy. The U.S. Navy is a leader in the development of modern diving and underwater operations. The general

requirements of national defense and the specific requirements of underwater reconnaissance, demolition, ordnance disposal, construction, ship maintenance, search, rescue and salvage operations repeatedly give impetus to training and development. Navy diving is no longer limited to tactical combat operations, wartime salvage, and submarine sinkings. Fleet diving has become increasingly important and diversified since World War II. A major part of the diving mission is inspecting and repairing naval vessels to minimize downtime and the need for dry-docking. Other aspects of fleet diving include recovering practice and research torpedoes, installing and repairing underwater electronic arrays, underwater construction, and locating and recovering downed aircraft.

The ANL Passive Acoustic Flow

Measurement System is a signal processor designed to measure the flow rate of particles suspended in a gas. The intended application is the measurement of char flow at the BI-GAS Pilot Plant, Homer City, PA. An undetected flow stoppage can very quickly cause a dangerous temperature excursion in the gasifier. At the request of BI-GAS, Argonne National Laboratory (ANL) has developed and installed acoustic monitors which give rapid indications of blockages or other flow perturbations in the char lines. These monitors use a high temperature microphone for measuring the acoustic attenuation caused by the presence of char in the lines. This manual describes the components and gives instructions for installation and operation of the system. Figure 1 shows the components of the flow measurement system. Detailed discussion of the principle of operation and design of the flow monitor may be found in Technical Memorandum An Acoustic Char Flow Monitor for the BI-GAS Pilot Plant, ANL-FE-49622-TM08, July 1979.

Designed by Grumman's brilliant Tom Kelly, the Apollo Lunar Excursion Module (or "LEM" for short) was a triumph of purpose-built engineering. In the six years 1962-1968 between drawing board and first flight, a myriad of challenges were overcome related to weight, reliability and safety. The final design, designated the Lunar Module or "LM," boasted tiny windows instead of large portholes, four legs instead of five and most famously had no seats instead relying on the astronauts' legs to cushion a lunar landing. Ten LMs made it into space including three flown in development and test missions, and six which landed on the Moon. A seventh famously saved the crew of Apollo 13 when that mission's Command Module suffered a catastrophic malfunction. Originally created for NASA by Grumman in 1964, this LEM Familiarization Manual provides an operational description of all subsystems and major components of the lunar lander. It includes sections about the LEM mission, spacecraft structure, operational subsystems, prelaunch operations, and ground support

equipment."
