Monthly Weather Review Academic Press
Weather Forecasting for Aeronautics provides forecasters and pilots wanting to study more about the art and science of predicting weather with the essential aids and methods for making practical application of their knowledge of the fundamentals of the science of meteorology. The publication first underscores the forecast problem, construction of the prognostic pressure chart, and prediction of cyclogenesis. Discussions focus on forecasting information concerning new cyclogenesis, making operational and planning forecasts,

cyclogenesis off the east coast of Asia, application of weather forecasts to operational problems, and cyclogenesis in the eastern United States. The text then ponders on forecasting the movement, deepening, and filling of cyclones and movement of anticyclones in North America. The manuscript takes a look at the movement of cold lows at the 500-millibar level and their influence on surface lows, displacement of surface cold fronts, and warm frontal analysis and movement. Topics include movement of warm fronts, identification and location of warm fronts, East Coast wedge type, and warm frontogenesis. The text then examines the movement of tropical cyclones, prediction of very low ceiling and fogs, and prediction of severe weather. The publication is a dependable reference for weather forecasters and pilots.

Weather Forecasting for Aeronautics

The purpose of this study was to search for a consistent link between temperature inversions and the occurrence of marine advection fog, in order that the temperature inversions could possibly be used as a forecasting aid at coastal stations. A data base of 10 months, July 1973 to April 1974, was used in the study, covering the summer, fall, and winter seasons. The inversion parameters investigated were the height of the inversion base, thickness of the inversion layer and the temperature gradient within the inversion layer. A relationship between the change in inversion parameters and the occurrence of fog was found to exist at San Diego, California, in the summer and winter seasons. At Oakland,

California, consistency in the change of at least one parameter was found in the summer and fall seasons, and the first two months of the winter season.
