TCRP Report 121: Toolkit for Integrating Non-Dedicated Vehicles in Paratransit Service is a toolkit that can be used by transportation managers to determine the appropriate split between dedicated and non-dedicated paratransit services to increase cost-effectiveness and meet peak demand needs. This report includes a Non-Dedicated Vehicle Optimization (NDV) Model and User Manual. The NDV Model is spreadsheet-based and may be used by paratransit system managers and planners to assist with making

decisions regarding appropriate service ratios for specific conditions and environments. In addition to the toolkit, a Case Study Report and an Interim Report (which includes an analysis of factors that influence the mix of dedicated and non-dedicated paratransit service) are available for download from the project's website.

This book contributes to making urban rail transport fast, punctual and energy-efficient –significant factors in the importance of public transportation systems to economic, environmental and social requirements at both municipal and national levels. It proposes new methods for shortening passenger travel times and for reducing energy consumption, addressing two major topics: (1) train trajectory planning: the authors derive a nonlinear model for the operation of trains and present several approaches for calculating optimal and energy-efficient trajectories within a given schedule; and (2) train scheduling: the authors

develop a train scheduling model for urban rail systems and optimization approaches with which to balance total passenger travel time with energy efficiency and other costs to the operator. Mixed-integer linear programming and pseudospectral methods are among the new methods proposed for single- and multi-train systems for the solution of the nonlinear trajectory planning problem which involves constraints such as varying speed restrictions and maximum traction/braking force. Signaling systems and their effects are also accounted for in the trajectory planning model. Origin–destination passenger demand is included in the model formulation for train scheduling. Iterative convex programming and efficient bi-level approaches are utilized in the solution of the train-scheduling problem. In addition, the splitting rates and route choices of passengers are also optimized from the system point of view. The problems and solutions described in *Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems* will interest researchers studying public transport systems and logistics whether from an academic or practitioner background as well as providing a real application for anybody studying optimization theory and predictive control.

Traffic Engineering Handbook, Seventh Edition is a newly revised text that builds upon the reputation as the go-to source of essential traffic engineering solutions that this book has maintained for the past 70 years. The updated content reflects changes in key industry standards, and shines a spotlight on the needs of all users, the design of context-sensitive roadways, and the development of more sustainable transportation solutions. Additionally, this resource features a new organizational structure that promotes a more functionally-driven, multimodal approach to planning, designing, and implementing transportation solutions. A branch of civil engineering, traffic engineering concerns the safe and efficient movement of people and goods along roadways. Traffic flow, road geometry, sidewalks, crosswalks, cycle facilities, shared lane markings, traffic signs, traffic lights, and more—all of these elements must be considered when designing public and private sector transportation solutions. Explore the fundamental concepts of traffic engineering as they relate to operation, design, and management Access updated content that reflects changes in key industry-leading resources, such as the Highway Capacity Manual (HCM), Manual on Uniform Traffic Control Devices (MUTCD), AASHTO Policy on Geometric Design, Highway Safety Manual (HSM), and Americans with Disabilities Act Understand the current state of the traffic engineering field Leverage revised information that homes in on the key topics most relevant to traffic engineering in today's world, such as context-sensitive roadways and sustainable transportation solutions *Traffic Engineering Handbook, Seventh Edition* is an essential text for public and private sector transportation practitioners, transportation decision

makers, public officials, and even upper-level undergraduate and graduate students who are studying transportation engineering.

Handbook of Railway Vehicle Dynamics, Second Edition, provides expanded, fully updated coverage of railway vehicle dynamics. With chapters by international experts, this work surveys the main areas of rolling stock and locomotive dynamics. Through mathematical analysis and numerous practical examples, it builds a deep understanding of the wheel-rail interface, suspension and suspension component design, simulation and testing of electrical and mechanical systems, and interaction with the surrounding infrastructure, and noise and vibration. Topics added in the Second Edition include

magnetic levitation, rail vehicle aerodynamics, and advances in traction and braking for full trains and individual vehicles.

The 1995 National Conference on Light Rail Transit (LRT), "Building on Success--Learning from Experience", emphasizes the lessons resulting from the maturing of North American LRT systems. The conference adds to the growing body of knowledge and real-world experiences with modern LRT applications. Volume 1, contains 36 conference papers, organized in four parts. Volume 2, contains both conference papers and associated papers presented at the 1996 Annual Meeting of the Transportation Research Board in Washington, D.C.
