Bayesian inference networks, a synthesis of statistics and expert systems, have advanced reasoning under uncertainty in medicine, business, and social sciences. This innovative volume is the first comprehensive treatment exploring how they can be applied to design and analyze innovative educational assessments. Part I develops Bayes nets ' foundations in assessment, statistics, and graph theory, and works through the real-time updating algorithm. Part II addresses parametric forms for use with assessment, model-checking techniques, and estimation with the

EM algorithm and Markov chain Monte Carlo (MCMC). A unique feature is the volume ' s grounding in Evidence-Centered Design (ECD) framework for assessment design. This “ design forward ” approach enables designers to take full advantage of Bayes nets ' modularity and ability to model complex evidentiary relationships that arise from performance in interactive, technology-rich assessments such as simulations. Part III describes ECD, situates Bayes nets as an integral component of a principled design process, and illustrates the ideas with an in-depth look at the BioMass project: An interactive, standards-based, web-delivered demonstration assessment of science inquiry in genetics. This book is both a resource for professionals interested in assessment and advanced students. Its clear exposition, worked-through numerical examples, and demonstrations from real and didactic applications provide invaluable illustrations of how to use Bayes nets in educational assessment. Exercises follow each chapter, and the online companion site provides a glossary, data sets and problem setups, and links to computational resources.

In the wake of recent federal legislation entitled No Child Left Behind, high-stakes standardized testing for accountability purposes is being emphasized in educational systems across the U.S. for all students – including English Language Learners (ELLs). Yet language proficiency mediates test performance, so ELLs typically receive scores far below those of other students. This book explores how tests have become de facto language policy in schools, shaping what is taught in school, how it is taught, and in what language(s) it is taught. In New York City, while most schools responded to testing by increasing the amount of English instruction offered to ELLs, a

few schools have preserved native language instruction instead.

Moreover, this research documents how tests are a defining force in the daily lives of ELLs and the educators who serve them.

Topics will include mental workload, decision-making, skilled performance, human-computer interaction, human reliability, work stress and training as these relate to human-system design. This book brings together a wide-ranging set of contributed articles that address emerging practices and future trends in cognitive engineering and neuroergonomics – both aim to harmoniously integrate human operator and computational system, the former through a tighter cognitive fit and the latter a more effective neural fit with the system. The chapters in this book uncover novel discoveries and communicate new understanding and the most recent advances in the areas of workload and stress, activity theory, human error and risk, and neuroergonomic measures, as well as associated applications.
