Davidson's 100 Clinical Cases was awarded First Prize in Medicine in the 2009 British Medical Association Medical Book Awards. This book reflects the real world in which doctors practise medicine. The selection of clinical problems guides the reader, step by step, through the correct path in the maze between the presenting complaint of a patient and the final diagnosis. The text emphasises the value of interpreting available clinical and investigative information in a logical way before considering a definitive diagnosis. The 100 cases are based on the 'presenting problems' of Davidson's Principles and Practice of Medicine. The book provides an international outlook reflecting the differences in the practice of medicine in the developing world and in low-resource settings, and addresses the epidemiological, economic and other reasons for many of these important differences. The cases are written by a team of senior doctors, from 12 countries, with considerable teaching experience. The book now includes 100 cases all closely linked to the 'presenting problems' sections of the latest 21st Edition of Davidson's Principles and Practice of Medicine. In this expanded new edition there are many new cases including aluminium phosphide poisoning; occupational lung disease; tremor; and drug interactions.

100 Cases in Clinical Medicine, Second Edition CRC Press
The aim of the 100 Cases series is to provide a novel learning and revision tool that works by guiding the student through clinical cases, imitating those that students and Foundation Year Doctors are likely to meet in a general practice setting. The cases are written to interest students in clinical problems and to help them develop their skills of clinical reasoning, with each scenario providing details of a patient's medical history and the key findings of a clinical examination, together with initial investigation results data for evaluation. Key questions then prompt the student to evaluate the patient, and reach a decision regarding their condition and the possible treatment plan; while the answer pages enable the reader to understand the processes a clinician goes through in such situations. The volumes are designed with the student in mind, and include features to aid self-directed learning, clinical thinking and problem-solving.

Oxford Cases in Medicine and Surgery, second edition, teaches students a hypothesis-driven, logical step-by-step approach to diagnosis when faced with each of 29 common patient presentations. This approach mirrors that used by successful clinicians on the wards, challenging students with questions at each stage of a case (history-taking, examination, investigation, management). In tackling these questions, students understand how to critically analyse information and learn to integrate their existing knowledge to a real-life scenario from start to finish. Each chapter focuses on a common presenting symptom (e.g. chest pain). By starting with a symptom, mirroring real life settings, students learn to draw on their knowledge of different physiological systems - for example, cardiology, respiratory, gastroenterology - at the same time. All the major presenting symptoms in general medicine and surgery (mapped to UK medical school curricula) are covered, together with a broad range of pathologies. This book is an essential resource for all medicine students, and provides a modern, well-rounded introduction to life on the wards. Ideal for those starting out in clinical medicine and an ideal refresher for those revising for OSCEs and finals.
