Dyslexia is a specific learning difficulty that hinders the learning of literacy skills. This problem with managing verbal codes in memory is neurologically based and tends to run in families. Other symbolic systems, such as mathematics and musical notation, can also be affected. Dyslexia can occur at any level of intellectual ability. It can accompany, but is not a result of, lack of motivation, emotional disturbance, sensory impairment or meagre opportunities. The effects of dyslexia can be

alleviated by skilled specialist teaching and committed learning. Moreover many dyslexic people have visual and spatial abilities which enable them to be successful in a wide range of careers. The appearance of this book .. is to be welcomed. It represents a full statement of the best practice to be found in the many kinds of intervention that are conducted with dyslexic students. It addresses some fundamental questions that are seldom asked and much of what the skilled teacher knows and does is set down here in print for the first time. From the Preface: `Collectively, the chapters provide a synthesis of current practice focusing on how to assess and treat the symptoms of dyslexia, guided by a proper understanding of the cognitive and linguistic weaknesses that underpin the condition. The book makes clear that the backbone of intervention for dyslexia is

a highly structured multisensory approach that teaches reading and spelling skills at the appropriate rate. However, it is also explicit in pointing out that such a programme must be delivered with due attention to individual differences in the other cognitive skills that contribute to literacy development, and take account of the learner's style, interests and not least their confidence and self-esteem. This book provides an important resource for teachers who wish to become competent in the skills required for the assessment, teaching, supporting and counselling of dyslexic people in a variety of settings. It promises to reach many teachers and in turn, their students and families'. Margaret J. Snowling, University of York, UK

In this extended meditation, Jean Lave interweaves analysis of the process of apprenticeship among the Vai and Gola tailors of Liberia with reflections on the evolution of her research on those tailors in the late 1970s. In so doing, she provides both a detailed account of her apprenticeship in the art of sustained fieldwork and an insightful overview of thirty years of changes in the empirical and theoretical facets of

ethnographic practice. Examining the issues she confronted in her own work, Lave shows how the critical questions raised by ethnographic research erode conventional assumptions, altering the direction of the work that follows. As ethnography takes on increasing significance to an ever widening field of thinkers on topics from education to ecology, this erudite but accessible book will be essential to anyone tackling the question of what it means to undertake critical and conceptually challenging fieldwork. Apprenticeship in Critical Ethnographic Practice explains how to seriously explore what it means to be human in a complex world—and why it is so important.

BEGINNING ALGEBRA: CONNECTING CONCEPTS THROUGH APPLICATIONS

shows students how to apply traditional mathematical skills in real-world contexts. The emphasis on skill building and applications engages

students as they master algebraic concepts, problem solving, and communication skills. Students learn how to solve problems generated from realistic applications, instead of learning techniques without conceptual understanding. The authors have developed several key ideas to make concepts real and vivid for students. First, they emphasize strong algebra skills. These skills support the applications and enhance student comprehension. Second, the authors integrate applications, drawing on realistic data to show students why they need to know and how to apply math. The applications help students develop the skills needed to explain the meaning of answers in the context of the application. Third, the authors develop key concepts as students progress through the course. For example, the distributive property is introduced in real numbers, covered when students are learning how to multiply a polynomial by a constant, and finally when students learn how to multiply a polynomial by a monomial. These concepts are reinforced through applications

in the text. Last, the authors' approach prepares students for intermediate algebra by including an introduction to material such as functions and interval notation as well as the last chapter that covers linear and quadratic modeling.
