This White Paper sets out a programme of reform to the UK's system for the regulation of health professionals. It contains a number of proposals with the aim of establishing a transparent system that can be seen to be independent and accountable and introduces the principle of revalidation so that registered professionals will have to demonstrate their continued fitness to practice. There will be changes in the way that problems will be handled. In the adjudication of fitness to practise cases panels should use civil standards of proof rather than the criminal standard and the Council for Healthcare Regulatory Excellence should have enhanced powers to supervise the regulators' handling of such cases. The Government agrees that there should be a separation of investigation and prosecution from adjudication and will work with the GMC to establish an independent body to adjudicate on fitness to practice cases involving the medical profession. Other topics covered in this document are: education and the role of regulatory bodies; information about health professional and regulation for emerging professions.

This is a book for tall people, those who relate to them, and anyone interested in height in general. Being tall coincides with considerable professional, athletic, and social benefits. Yet there are also some problems, and these raise some questions. For instance, if longer levers and more cells really are behind increased risk of injuries and cancer, then how is it that giraffes get by? And why is it that society reveres tall stature but then compromises our safety with cramped cars and other things? These questions and more will all be answered by a tall protagonist over eight chapters: Evolution, Scaling, Spine, Manufactured, Ergonomics, Growth, Longevity, and Society.

For a century, almost all light-duty vehicles (LDVs) have been powered by internal combustion engines operating on petroleum fuels. Energy security concerns about

petroleum imports and the effect of greenhouse gas (GHG) emissions on global climate are driving interest in alternatives. Transitions to Alternative Vehicles and Fuels assesses the potential for reducing petroleum consumption and GHG emissions by 80 percent across the U.S. LDV fleet by 2050, relative to 2005. This report examines the current capability and estimated future performance and costs for each vehicle type and non-petroleum-based fuel technology as options that could significantly contribute to these goals. By analyzing scenarios that combine various fuel and vehicle pathways, the report also identifies barriers to implementation of these technologies and suggests policies to achieve the desired reductions. Several scenarios are promising, but strong, and effective policies such as research and development, subsidies, energy taxes, or regulations will be necessary to overcome barriers, such as cost and consumer choice.
