the invitation of the
Government of

Norway. It was organized under the auspices of the Timber Committee, a subsidiary body of the United Nations Economic Commission for Europe (ECE) in Geneva, Switzerland. Participants represented the ECE member countries of Belgium, Canada, Denmark, Finland, France, Federal Republic of Germany, Hungary, Ireland, Italy, Netherlands, Norway, Poland, Sweden, Union of Soviet Socialist Republics, United Kingdom of Great Britain and Northern Ireland and United States of America. Observers from Australia and South

Africa attended as well, and the United Nations Organization for Industrial Development (UNIDO) was represented. Mr. R. Birkeland of Norway was elected Chairman, and Mr. V. Turushev of the USSR Vice-Chairman. During the seminar, study visits were arranged for participants: to Berger Langmoen A. S., Brumunddal, which produces sawnwood, planed wood, wooden packaging, building components using finger-jointed timber, parquet flooring and fibreboard; to the Moelven Group, Moelv, which

produces modular houses and other types of timber-framed buildings and building panels, sawnwood, glue-laminated products, skis, etc., as well as a number of types of mechanical equipment and vehicles.

Topology is a branch of pure mathematics that deals with the abstract relationships found in geometry and analysis. Written with the mature student in mind, *Foundations of Topology*, Second Edition, provides a user-friendly, clear, and concise introduction to

area of mathematics. The author introduces topics that are well motivated with thorough proofs that make them easy to follow. Historical comments are dispersed throughout the text, and exercises, varying in degree of difficulty, are found at the end of each chapter. *Foundations of Topology* is an excellent text for teaching students how to develop the skill to write clear and precise proofs.

Educational Publishers Studying engineering, whether it is mechanical, electrical or civil relies heavily on an understanding of mathematics. This new textbook clearly demonstrates the relevance of mathematical principles and shows how to apply them to solve real-life engineering problems. It deliberately starts at an elementary level so that students who are starting from a low knowledge base will be able to quickly get up to the level

required. Students who have not studied mathematics for some time will find this an excellent refresher. Each chapter starts with the basics before gently increasing in complexity. A full outline of essential definitions, formulae, laws and procedures are introduced before real world situations, practicals and problem solving demonstrate how the theory is applied. Focusing on learning through practice, it contains examples, supported by 1,600 worked

problems and 3,000 further problems contained within exercises throughout the text. In addition, 34 revision tests are included at regular intervals. An interactive companion website is also provided containing 2,750 further problems with worked solutions and instructor materials

50 years of DNA double helix; what was before, and afterwards The present book, although written mainly for science students and research scientists, is also aimed at those readers who look at science, not for its own sake, but in search of a better understanding of our world in general. What were the fundamental questions asked by the early pioneers of molecular biology? What made them tick for decades, trying to elucidate the basic mechanisms of heredity and life itself? In each chapter, the development of a

particular aspect of modern biology is described in a historical and logical context, not missing to take into account human aspects of the protagonists of the story. At the end of each chapter, there are some excursus with additional information, technical and otherwise, which can be read separately. The book is enriched with many illustrations, including facsimile reproductions from the original descriptions of key experiments.
