The Chemistry Maths Book is a comprehensive textbook of mathematics for undergraduate students of chemistry.

Such students often find themselves unprepared and ill-equipped to deal with the mathematical content of their

chemistry courses. Textbooks designed to overcome this problem have so far been too basic for complete

undergraduate courses and have been unpopular with students. However, this modern textbook provides a complete

and up-to-date course companion suitable for all levels of undergraduate chemistry courses. All the most

useful and important topics are covered with numerous examples of applications in chemistry and some in

physics. The subject is developed in a logical and consistent way with few assumptions of prior knowledge of

mathematics. This text is sure to become a widely adopted text and will be highly recommended for all

chemistry courses.

Targeting Mathematics (CCE) – 8 Singapore Asian Publications

This book is the result of two courses of lectures given at the University of Cologne in Germany in 1974/75. The majority of the students were not familiar with partial differential equations and functional analysis. This explains why Sections 1, 2, 4 and 12 contain some basic material and results from these areas. The three parts of the book are largely independent of each other and can be read separately. Their topics are: initial value problems, boundary value problems, solutions of systems of equations. There is much emphasis on theoretical considerations and they are discussed as thoroughly as the algorithms which are presented in full detail and together with the programs. We believe that theoretical and practical applications are equally important for a genuine understanding of numerical mathematics. When writing this book, we had considerable help and many discussions with H. W. Branca, R. Esser, W. Hackbusch and H. Multhei. H. Lehmann, B. Muller, H. J. Niemeyer, U. Schulte and B. Thomas helped with the completion of the programs and with several numerical calculations. Springer-Verlag showed a lot of patience and understanding during the course of the production of the book. We would like to use the occasion of this preface to express our thanks to all those who assisted in our sometimes arduous task.

S. Chand's Smart Maths book 4 Vikas Publishing House

Elementary Differential Equations and Boundary Value Problems, 12th Edition is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. In this revision, new author Douglas Meade focuses on developing students conceptual understanding with new concept questions and worksheets for each chapter. Meade builds upon Boyce and DiPrima's work to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a wide variety of applications. The main prerequisite for engaging with the program is a working knowledge of calculus, gained from a normal two or three semester course sequence or its equivalent. Some familiarity with matrices will also be helpful in the chapters on systems of differential equations.
