volume report the results from the projects funded by the programme, which ran between 1997 and 2001. An earlier volume, published in 2000, reported interim results. Bringing together researchers from diverse backgrounds in Computer Science, Information Systems, Engineering and Business Schools, this book explores the problems experienced by IT-dependent businesses that have to implement changing business processes in the context of their

investment in legacy systems. The book presents some of the solutions investigated through the collaborations set up within the research programme. Whether you are a researcher interested in the ideas that were generated by the research programme, or a user trying to understand the nature of the problems and their solutions, you cannot fail to be inspired by the writings contained in this volume.

advances in diagnostic radiology in the last few decades have transformed clinical practice and have been nothing short of astonishing. The subject of diagnostic radiology is now very large and radiology departments are involved in all areas of modern patient care. The defining event in modern radiology, and arguably the most significant development in radiology since Wilhelm Röntgen discovered X-rays, was the invention of the CT scanner in the 1970s. The CT scanner introduced modern cross-sectional imaging and also digital imaging. We now have MRI and ultrasound and these techniques are replacing many traditional X-ray procedures. The developments in radiology have been the result of a fruitful interaction between the basic sciences, clinical medicine and the manufacturers. This can be seen by looking at the various sources of these publications. Change is produced by the interactions between the various disciplines. The editors have had a very difficult task in selecting the key discoveries and descriptions. The radiological

literature is very large. Medical imaging continues to develop rapidly and these papers are the foundations of our current practice.

The interplay between

combinatorics and theoretical physics is a recent trend which

appears to us as particularly natural, since the unfolding of

new ideas in physics is often tied to the development of

combinatorial methods, and, conversely, problems in

combinatorics have been successfully tackled using

methods inspired by theoretical physics. We can thus speak

nowadays of an emerging domain of Combinatorial

Physics. The interference between these two disciplines is

moreover an interference of multiple facets. Its best known

manifestation (both to combinatorialists and theoretical

physicists) has so far been the one between combinatorics and

---

statistical physics, as statistical physics relies on an accurate counting of the various states or configurations of a physical system. But combinatorics and theoretical physics interact in various other ways. This book is mainly dedicated to the interactions of combinatorics (algebraic, enumerative, analytic) with (commutative and non-commutative) quantum field theory and tensor models, the latter being seen as a quantum field theoretical generalisation of matrix models.

Symmetry principles play a fundamental role in modern

nuclear and particle physics. The study of symmetry principles, which govern the Universe in which we live, is absolutely fundamental to modern subatomic physics. Our quantum field theories are built around these symmetries which their occasional violation not only surprises or delights, but can also offer deep insight into the dynamics of complicated systems. This meeting brought together experts from around the world who are pushing our knowledge of symmetries such as parity, charge conjugation, and even Lorentz invariance to the limits. Future developments in theoretical subatomic physics may be completely altered by hitherto unexpected discoveries of symmetry breaking. From neutrino oscillations to B-factories, from beta decay to colliders to masers, the latest theoretical and experimental developments in this field are

documented. These proceedings present a valuable snapshot of the state of the art.

### *Conference Papers*

This book constitutes invited papers from the First International Workshop on Frontiers in Software Engineering Education, FISEE 2019, which took place during November 11-13, 2019, at the Château de Villebrumier, France. The 25 papers included in this volume were considerably enhanced after the conference and during two different peer-review

phases. The contributions cover a wide range of problems in teaching software engineering and are organized in the following sections: Course experience; lessons learnt; curriculum and course design; competitions and workshops; empirical studies, tools and automation; globalization of education; and learning by doing. The final part "TOOLS Workshop: Artificial and Natural Tools (ANT)" contains submissions presented at a different, but related, workshop run at Innopolis University (Russia) in the context of the TOOLS 2019 conference. FISEE 2019 is part of a series of scientific events held at the new LASER center in Villebrumier near Montauban and Toulouse, France.

## Physics Express

This collection is devoted to problems of operator theory with a random potential and a number of problems of statistical physics. For the Schrodinger operator with a potential randomly depending on time, mean wave operators, and the mean scattering operator are computed, and it is shown that the averaged dynamics behaves like free dynamics in the limit of infinite time. Results of applying the method of functional integration to some problems of statistical physics are presented: the theory of systems with model Hamiltonians and their dynamics, ferromagnetic systems of spin  $1/2$ , Coulomb and quantum crystals. This collection is intended for specialists in spectral theory

and statistical physics.
