Verification of real-time requirements in systems-on-chip becomes more complex as more applications are integrated. Predictable and composable systems can manage the increasing complexity using formal verification and simulation. This book explains the concepts of predictability and composability and shows how to apply them to the design and analysis of a memory controller, which is a key component in any real-time system.

Intelligent readers who want to build their own embedded computer systems-- installed in everything from cell phones to cars to handheld organizers to refrigerators-- will find this book to be the most in-depth, practical, and up-to-date guide on the market.

Designing Embedded Hardware carefully steers between the practical and philosophical aspects, so developers can both create their own devices and gadgets and customize and extend off-the-

shelf systems. There are hundreds of books to choose from if you need to learn programming, but only a few are available if you want to learn to create hardware. Designing Embedded Hardware provides software and hardware engineers with no prior experience in embedded systems with the necessary conceptual and design building blocks to understand the architectures of embedded systems. Written to provide the depth of coverage and real-world examples developers need, Designing Embedded Hardware also provides a road-map to the pitfalls and traps to avoid in designing embedded systems.

Designing Embedded Hardware covers such essential topics as: The principles of developing computer hardware Core hardware designs Assembly language concepts Parallel I/O Analog-digital conversion Timers (internal and external) UART Serial Peripheral Interface Inter-Integrated Circuit Bus Controller Area Network (CAN) Data Converter Interface (DCI) Low-power operation This invaluable and eminently useful book gives you the practical tools and skills to develop, build, and program your own application-specific computers.

Until recently, economists studying economic development have tended to consider it as a universal process, or focussed their attention on common aspects. This book originates from the growing recognition of significant sectoral differences in economic development and examines the catching-up process in five different economic sectors: pharmaceuticals, telecommunications equipment, semiconductors, software, and agro-food industries. Each of these

sector studies explore the learning and catch-up processes in various developing countries, in order to identify both the common features, and those which differ significantly across sectors and nations. The authors pay particular attention to China, India, Brazil, Korea and Taiwan. Edited by two of the leading scholars in the field, this book will prove to be invaluable for academics and postgraduate students interested in economic and technological development, and evolutionary economics.
