This volume addresses the  
interface of two major national  
problems: the epidemic of HIV-  
AIDS and the widespread use of  
illegal injection drugs. Should  
communities have the option of  
giving drug users sterile needles  
or bleach for cleaning needs in  
order to reduce the spread of  
HIV? Does needle distribution

worsen the drug problem, as  
opponents of such programs  
argue? Do they reduce the spread  
of other serious diseases, such as  
hepatitis? Do they result in more  
used needles being carelessly  
discarded in the community? The  
panel takes a critical look at the  
available data on needle exchange  
and bleach distribution programs,  
reaches conclusions about their  
efficacy, and offers concrete  
recommendations for public  
policy to reduce the spread of  
HIV/AIDS. The book includes  
current knowledge about the  
epidemiologies of HIV/AIDS and  
injection drug use; characteristics  
of needle exchange and bleach  
distribution programs and views  
on those programs from diverse  
community groups; and a  
discussion of laws designed to  
control possession of needles,  
their impact on needle sharing  
among injection drug users, and  
their implications for needle  
exchange programs.

Biochar is the carbon-rich product when biomass (such as wood, manure or crop residues) is heated in a closed container with little or no available air. It can be used to improve agriculture and the environment in several ways, and its stability in soil and superior nutrient-retention properties make it an ideal soil amendment to increase crop yields. In addition to this, biochar sequestration, in combination with sustainable biomass production, can be carbon-negative and therefore used to actively remove carbon dioxide from the atmosphere, with major implications for mitigation of climate change. Biochar production can also be combined with bioenergy production through the use of the gases that are given off in the pyrolysis process. This book is the first to synthesize the expanding research literature on this topic. The book's interdisciplinary approach, which covers engineering, environmental sciences, agricultural sciences, economics and policy, is a vital tool at this stage of biochar technology development. This comprehensive overview of current knowledge will be of

interest to advanced students, researchers and professionals in a wide range of disciplines.

This volume is the newest release in the authoritative series of quantitative estimates of nutrient intakes to be used for planning and assessing diets for healthy people. Dietary Reference Intakes (DRIs) is the newest framework for an expanded approach developed by U.S. and Canadian scientists. This book discusses in detail the role of vitamin C, vitamin E, selenium, and the carotenoids in human physiology and health. For each nutrient the committee presents what is known about how it functions in the human body, which factors may affect how it works, and how the nutrient may be related to chronic disease. Dietary

Reference Intakes provides reference intakes, such as Recommended Dietary Allowances (RDAs), for use in planning nutritionally adequate diets for different groups based on age and gender, along with a new reference intake, the Tolerable Upper Intake Level (UL), designed to assist an individual in knowing how much is "too much" of a nutrient.
