The understanding of adhesion and interfacial effects has benefited from various technological advances in recent years. Advances in laboratory equipment, analytical tools such as the nanoindenter, SIMS, and ESCA, and improvements in computing technology have greatly expanded the relevant body of knowledge. Rapid progress in adhesion and interfacial science has made dissemination of results in a timely fashion more important than ever. Accordingly, the editors of this book organized an ACS symposium, sponsored by the Division of Polymer Chemistry, entitled Fundamentals of Adhesion and Interfaces. The papers in this volume were

selected from those presented at the symposium.

Metal matrix composites are making tangible inroads into the "real" world of engineering. They are used in engineering components such as brake rotors, aircraft parts, combustion engines, and heat sinks for electronic systems. Yet, outside a relatively limited circle of specialists, these materials are mostly unknown. Designers do not as a rule think of using these materials, in part because access to information is difficult as these

materials have not really entered engineering handbooks. Metal Matrix Composites in Industry is thus useful to engineers who wish to gain introductory knowledge of these materials and who want to know where "to find" them. Additionally, it provides researchers and academics with a survey of current industrial activity in this area of technology.

Alfa Romeo 916 GTV and Spider traces the complete story of the Alfa Romeo GTV and Spider models produced between 1994 - 2005, commonly known to enthusiasts by the manufacturer's project code as the 916 series. The 916 models would always be controversial - they replaced the iconic Spider, the best-selling Alfa Romeo sports model of all time, and the brand-establishing Alfetta GTV. Sharing components and a platform with a humble Fiat hatchback, would the cars ever be considered 'real' Alfa Romeos? The cars were critically acclaimed, and, though they faced tough competition in the late 1990s from the likes of the Audi TT, they remained in production for over a decade. Topics covered include: Full history of the 916 series GTV and Spider models; Design, development and evolution of the models from 1994 - 2005; Participation of the GTV in motorsport; Model variations in depth through all three facelifts; Previously unpublished production figures, and chassis numbers for the desirable, limited-edition GTV Cup model. Comprehensively researched guide to the entire lifespan of the 916 series. Will appeal to Alfa Romeo and automotive enthusiasts. The history and design process are examined along with an in-depth guide to each of the model variants produced. The cars' current position in the classic car market is considered. Superbly illustrated with 240 colour

photographs. Robert Foskett is a life-long Italian car enthusiast with a special interest in Alfa Romeo.

Research into the manufacture of lightweight automobiles is driven by the need to reduce fuel consumption to preserve dwindling hydrocarbon resources without compromising other attributes such as safety, performance, recyclability and cost. Materials, design and manufacturing for lightweight vehicles will make it easier for engineers to not only learn about the materials being considered for lightweight automobiles, but also to compare their characteristics and properties. Part one discusses materials for lightweight automotive structures with chapters on advanced steels for lightweight automotive structures, aluminium alloys, magnesium alloys for lightweight powertrains and automotive structures, thermoplastics and thermoplastic matrix composites and thermoset matrix composites for lightweight automotive structures. Part two reviews manufacturing and design of lightweight automotive structures covering topics such as manufacturing processes for light alloys, joining for lightweight vehicles, recycling and lifecycle issues and crashworthiness design for

lightweight vehicles. With its distinguished editor and renowned team of contributors, *Materials, design and manufacturing for lightweight vehicles* is a standard reference for practicing engineers involved in the design and material selection for motor vehicle bodies and components as well as material scientists, environmental scientists, policy makers, car companies and automotive component manufacturers. - Provides a comprehensive analysis of the materials being used for the manufacture of lightweight vehicles whilst comparing characteristics and properties - Examines crashworthiness design issues for lightweight vehicles and further emphasises the development of lightweight vehicles without compromising safety considerations and performance - Explores the manufacturing process for light alloys including metal forming processes for automotive applications

September 1962: On a moonless night over the raging Atlantic Ocean, a thousand miles from land, the engines of Flying Tiger flight 923 to Germany burst into flames, one by one. Pilot John Murray didn't have long before the plane crashed headlong into the 20-foot waves at 120 mph. As the four flight attendants donned life vests, collected sharp objects, and explained how to brace for the ferocious impact, 68 passengers clung to their seats: elementary schoolchildren from Hawaii, a teenage newlywed from Germany, a disabled Normandy vet from Cape Cod, an immigrant from Mexico, and 30 recent graduates of the 82nd Airborne's Jump School. They all expected to die. Murray

radioed out “Mayday” as he attempted to fly down through gale-force winds into the rough water, hoping the plane didn’t break apart when it hit the sea. Only a handful of ships could pick up the distress call so far from land. The closest was a Swiss freighter 13 hours away. Dozens of other ships and planes from 9 countries abruptly changed course or scrambled from Canada, Iceland, Ireland, Scotland, and Cornwall, all racing to the rescue—but they would take hours, or days, to arrive. From the cockpit, the blackness of the Atlantic grew ever closer. Could Murray do what no pilot had ever done—“land” a commercial airliner at night in a violent sea without everyone dying? And if he did, would rescuers find any survivors before they drowned or died from hypothermia in the icy water? The fate of Flying Tiger 923 riveted the world. Bulletins interrupted radio and TV programs. Headlines shouted off newspapers from London to LA. Frantic family members overwhelmed telephone switchboards. President Kennedy took a break from the brewing crises in Cuba and Mississippi to ask for hourly updates. Tiger in the Sea is a gripping tale of triumph, tragedy, unparalleled airmanship, and incredibly brave people from all walks of life. The author has pieced together the story—long hidden because of murky Cold War politics—through exhaustive research and reconstructed a true and inspiring tribute to the virtues of outside-the-box-thinking, teamwork, and hope.
