The last ten years have seen rapid advances in nanoscience and nanotechnology, allowing unprecedented manipulation of the nanoscale structures controlling solar capture, conversion, and storage. Filled with cutting-edge solar energy research and reference materials, the Handbook of Research on Solar Energy Systems and Technologies serves as a one-stop resource for the latest information regarding different topical areas within solar energy. This handbook will emphasize the application of nanotechnology innovations to solar energy technologies, explore current and future developments in third generation solar cells, and provide a detailed economic analysis of solar energy applications.

The growth of Shanghai in the late nineteenth century gave rise to an exciting new art world in which a flourishing market in popular art became a highly visible part of the treaty port's commercialized culture. Art Worlds examines the relationship between the city's visual artists and their urban audiences. Through a discussion of images ranging from fashionable painted fans to lithograph-illustrated magazines, the book explores how popular art intersected with broader cultural trends. It also investigates the multiple roles played by the modern Chinese artist as image-maker, entrepreneur, celebrity, and urban sojourner. Focusing on industrially produced images, mass advertisements, and other hitherto neglected sources, the book offers a new interpretation of late Qing visual culture at a watershed moment in the history of modern Chinese art. Art Worlds will be of interest to scholars of art history and to anyone with an interest in the cultural history of modern China. "By focusing on objects, sites, social networks, and technologies, this elegantly conceived book enriches our understanding of art production and consumption in nineteenth-century Shanghai. The author makes masterful use of newspapers, guidebooks, diaries, and advertisements—as well as paintings—to present readers with the compelling story of a city and its artists." —Tobie Meyer-Fong, author of

What Remains: Coming to Terms with Civil War in 19th Century China and Building Culture in Early Qing Yangzhou "Rich in findings, forensic in visual analysis and—not least—elegantly crafted, Wue's book on painting, printing and the social worlds of art in late-Qing Shanghai is an exemplary contribution. A must-read volume." —Shane McCausland, author of Zhao Mengfu: Calligraphy and Painting for Khubilai's China

Hearing loss is the most common form of sensory impairment in humans, affecting 360 million persons worldwide. In parallel, tinnitus disorder, the perception of a phantom sound often described as a ringing or buzzing, affects around 10–15% of the general population and interferes with daily life. Hyperacusis, defined as a hypersensitivity to moderate-intensity sounds often co-occurs with tinnitus suggesting a common mechanism of dysfunction for these two perceptual disorders. Whereas some drug candidates are in the process of being developed, nowadays no effective treatment exists to cure hearing loss and tinnitus. The topic of this book was selected with the goal of emphasizing mechanisms that induce hearing loss and tinnitus which lead the selection of promising targets for hearing disorder treatment. Hair cells (HC) are the sensory cells of the inner ear required for both auditory and vestibular functions in all vertebrates. HC are progressively lost during ageing and they are in addition sensitive to physical and acoustic traumas, infectious diseases and chemicals present in commonly used treatments such as anticancer, antimalarial or antibiotics. As adult mammals—including humans--cannot regenerate dead HC, all the possible injury could result in irreversible and permanent

hearing loss. It has been shown, however, that a limited capacity to regenerate HC exists in mouse at an early stage of development. The regenerative capacity of HC then appears simply “repressed” in adult mammals, and one could expect it will be possible to re-activate it with an appropriate therapeutic approach which is still to be defined. Immune-mediated inner ear disease has been introduced and accepted as one SNHL pathophysiology; it responds to immunosuppressive therapy and is one of the few reversible forms of bilateral SNHL.

Macrophages are always present in the spiral ligament of the lateral wall and are activated in response to various types of stimuli, including noise exposure, ischemia, mitochondrial damage, and surgical stress. Recent studies have also revealed another type of immune cell, called perivascular melanocyte-like macrophages (PVM/Ms), in the stria vascularis. The book will include a review of inflammatory/immune cells in the cochlear lateral wall, the pathways involved in cochlear damage and their potential as therapeutic targets. The final chapter provides an overview of current animal model of tinnitus and hyperacusis. Nowadays no effective treatment exists to cure tinnitus and hyperacusis. One major obstacle to arises from the fact that tinnitus is a subjective phenomenon, the only possible diagnosis relies on self-reports of the subjects. The main constraint of the use of animal models is the subjective character of tinnitus. This chapter describe the advancement in animal models which play an important role in revealing the underlying mechanisms and treatment for tinnitus and hyperacusis.
