A truly classic air pollution text, this book is  
suitable for a variety of engineers and  
scientists who wish to gain an introduction  
to the field of air pollution. Known for its

detailed development and application of  
equations, the text emphasizes an  
understanding of the relationship between  
sources and control of air pollution, rather  
than being a simple "handbook" on the  
subject. The book presents information on  
four broad areas of interest in the air  
pollution field: the effects of pollutants on  
health and welfare; the laws and  
regulations that have been passed in efforts  
to improve air quality; the modeling of  
atmospheric dispersion of pollutants; the  
approaches to the control of emissions  
(from both stationary and mobile sources).  
The third edition of this text has been  
modified in a number of ways. New material  
has been added to bring the text up to date  
on the latest regulations including the Clean  
Air Act Amendments of 1990. The latest

---

standards for ambient air quality and emission have been included in this revision. The authors continue to expose students to both the quantitative and the qualitative aspects of air quality management and air pollution control with several new questions and problems, with SI units emphasized to a greater extent than in the previous edition. The internet is also introduced as a valuable source of additional information. A web page is maintained by the authors which provides links to sources of interest to both instructors and students.
