This book is the distillation of many years experience of working with Weber carburetors.

These celebrated carburetors have been fitted to some of the most exciting and memorable cars and have been more widely used by tuners and modifiers, both for road and competition machinery, than any alternative. The mysteries of why and how they work so well and the practicalities of getting the best from them in any application are explained at length. Setting the carburetor to suit a particular engine, fault-finding on an existing installation, and the maintenance and repair of older carburetors are all topics which receive detailed attention. Anyone maintaining or restoring a classic Weber-equipped car, or contemplating a Weber-based conversion, or simply interested in the science of engine performance and tuning, will learn something from these pages. Guy Stewart Callendar (1898 – 1964) is noted for identifying, in 1938, the link between the artificial production of carbon dioxide and global warming. Today this is called the “ Callendar Effect. ” He was one of Britain ’ s leading steam and combustion engineers, a specialist in infrared physics, author of the standard reference book on the properties of steam at high tempe- tures and pressures, and designer of the burners of the notable World War II airfield fog dispersal system, FIDO. He was keenly interested in weather and climate, taking measurement so accurate that they were used to correct the ofcial temperature records of central England and collecting a series of

worldwide weather data that showed an unprecedented warming trend in the first four decades of the twentieth century. He formulated a coherent theory of infrared absorption and emission by trace gases, established the nineteenth-century background concentration of carbon dioxide, and - gued that its atmospheric concentration was rising due to human activities, which was causing the climate to warm. Callendar ’ s contributions to climatology led the way in the mid-twentie- century transition from the traditional practice of gathering descriptive c- mate statistics to the new and exciting feld of climate dynamics. In the first half of the twentieth century, the carbon dioxide theory of climate change xiv Introduction had fallen out of favor with climatists.
