Sixth in a series of congressionally mandated studies, this book is an updated review and evaluation of the available evidence regarding the statistical association between exposure to herbicides used in Vietnam and various adverse health outcomes suspected to be linked with such exposure. This book builds upon the information contained in the earlier books in the series: Veterans and Agent Orange: Health Effects of Herbicides Used in Vietnam (1994) Veterans and Agent Orange: Update 1996 Veterans and Agent Orange: Update 1998 Veterans and Agent Orange: Update 2000 Veterans and Agent Orange: Update 2002 Veterans and Agent Orange: Herbicides and Dioxin Exposure and Type 2 Diabetes (2000) Veterans and Agent Orange: Herbicide/Dioxin Exposure and Acute Myelogenous Leukemia in the Children of Vietnam Veterans (2002) Veterans and Agent Orange: Update 2004 focuses primarily on scientific studies and other information developed since the release of these earlier books. The previous volumes have noted that sufficient evidence exists to link chronic lymphocytic leukemia, soft-tissue sarcoma, non-Hodgkin's lymphoma, Hodgkin's disease, and chloracne with exposure. The books also noted that there is "limited or suggestive" evidence of an association between exposure and respiratory cancers, prostate cancer, multiple myeloma, the metabolic disorder porphyria cutanea tarda, early-onset transient peripheral neuropathies, Type 2 diabetes, and the congenital birth defect spinal bifida in veterans' children. This volume will be critically important to both policymakers and physicians in the federal government, Vietnam veterans and their families, veterans' organizations, researchers, and health professionals.

To safeguard public health, the US Environmental Protection Agency (EPA) must keep abreast of new scientific information and emerging technologies so that it can apply them to regulatory decision-making. For decades the agency has dealt with questions about what animal-testing data to use to make predictions about human health hazards, how to perform dose-response extrapolations, how to identify and protect susceptible subpopulations, and how to address uncertainties. As alternatives to traditional toxicity testing have emerged, the agency has been faced with additional questions about how to incorporate data from such tests into its chemical assessments and whether such tests can replace some traditional testing methods. Endocrine active chemicals (EACs) have raised

concerns that traditional toxicity-testing protocols might be inadequate to identify all potential hazards to human health because they have the ability to modulate normal hormone function, and small alterations in hormone concentrations, particularly during sensitive life stages, can have lasting and significant effects. To address concerns about potential human health effects from EACs at low doses, this report develops a strategy to evaluate the evidence for such low-dose effects.

"Through this comprehensive review of internal medicine, we sought to capture the essential concepts and key elements of our specialty by focusing on general internal medicine and the numerous medical subspecialties. Although internal medicine is constantly evolving, there are basic principles and thought processes that remain the essence of our specialty. Learning the facts is only the beginning. Medical students must develop their skills in deductive reasoning and synthesize these facts, weighing the pros and cons of the evaluation and management choices for their patients"--Provided by publisher.

This new edition of the bestselling Responding to Domestic Violence explores the response to domestic violence today, not only by the criminal justice system, but also by public and non-profit social service and health care agencies. After providing a brief theoretical overview of the causes of domestic violence and its prevalence in our society, the authors cover such key topics as barriers to intervention, variations in arrest practices, the role of state and federal legislation, and case prosecution. Focusing on both victims and offenders, the book includes unique chapters on models for judicial intervention, domestic violence and health, and children and domestic violence. In addition, this edition provides an in-depth discussion of the concept of coercive control in domestic violence and its importance in understanding victim needs. Finally, this volume includes international perspectives in order to broaden the reader's understanding of alternative responses to the problem of domestic violence.

Biology of Sex is a lively and intellectually challenging textbook. Mills analyzes the biological basis of sex by considering genetic, physiological, and evolutionary principles. In order to explain the biological aspects of human sex, he uses direct and intriguing comparisons with the many variations in sexual systems among non-human organisms. Text boxes provide fascinating examples: non-human species that cannibalize their partners during copulation, organisms that do not fall within one of two biological sexes, and species that "trick" others into raising their young. The author also explores questions such as: "Is sex only for reproduction?", "is sex pleasurable?", and "What are the roots of sexual conflict?" Intended primarily for readers without a science background, Biology of Sex provides novel content from the human and non-human worlds to introduce the complex subject of sex and reproduction.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
