That is why it is so important for consumers to do extensive research so they can avoid all of the pitfalls of the used car market category. The auto experts at "Consumer Reports" have done the work for you and have compiled their extensive research and report their findings into the 2006 edition of "Used Car Buying Guide." Volume II of this mammoth reference work covers the years in which the League of Nations failed because of the emerging dictatorships in Germany and Italy and the expansionist policies adopted by Japan. Britain was still reeling from the consequences of World War I and the RAF was sadly far behind the other major world powers in aircraft design, still relying on bi-planes that were direct descendants of World War I thinking. It gradually became apparent that, despite UK government dithering, the RAF needed to develop new aircraft, engines and increase production to confront the bully-boy tactics of the Axis powers. As the turn of the decade approached extraordinary measures were taken to enable RAF to defend Britain's skies and this her freedom. As with Volume 1, this book covers every conceivable part of the RAF's history through these pre-War days. It looks at the development and invention of new equipment such as radar, monoplane fighters, metal

construction and the heavy bomber. This was an era when science in service bulletins granting free repairs, and more.

As Dr Needham's immense undertaking gathers momentum it has been found necessary to subdivide volumes into parts, each to be bound and published separately. The first part of Volume 4, already published, deals with the physical sciences; the second with the diverse applications of physics in the many branches of mechanical engineering; and the third will deal with civil and hydraulic engineering and nautical technology. With this part of Volume 4, then, we come to the application by the Chinese of physical principles in the control of forces and in the use of power; we cross the frontier separating tools from the machine. We have already noticed that the ancient Chinese concept of chhi (somewhat similar to the pneuma of the Greeks) asserted itself prominently in acoustics; but we discover here that the Chinese tendency to think pneumatically was also responsible for a whole range of brilliant technological achievements, for example, the double-acting piston-bellows, the rotary winnowing-fan, and the water-powered metallurgical blowing-machine (ancestor of the steam-engine); as well as for some extraordinary insights and predictions in aeronautics.
