BoD – Books on Demand
This book constitutes the proceedings of the 4th World Summit on the Knowledge Society, WSKS 2011, held in Mykonos, Greece, in September 2011. The 90 revised full papers presented were carefully reviewed and selected from 198 submissions. The papers address issues such as information technology, e-learning, e-business, cultural heritage, e-government.

Information Systems, E-learning, and Knowledge Management Research Graphic Communications Group
Albert Abramson published (with McFarland) in 1987 a landmark volume titled *The History of Television, 1880-1941* (massive...research--Library Journal; voluminous documentation--Choice; many striking old photos--The TV Collector). At last he has produced the follow-up volume; the reader may be assured there is no other book in any language that is remotely comparable to it. Together, these two volumes provide the definitive technical history of the medium. Upon the development in the mid-1940s of new cameras and picture tubes that made commercial television possible worldwide, the

medium rose rapidly to prominence. Perhaps even more important was the invention of the video tape recorder in 1956, allowing editing, re-shooting and rebroadcasting. This second volume, 1942 to 2000 covers these significant developments and much more. Chapters are devoted to television during World War II and the postwar era, the development of color television, Ampex Corporation's contributions, television in Europe, the change from helical to high band technology, solid state cameras, the television coverage of Apollo II, the rise of electronic journalism, television entering the studios, the introduction of the camcorder, the demise of RCA at the hands of GE, the domination of Sony and Matsushita, and the future of television in e-

cinema and the 1080 P24 format. The book is heavily illustrated (as is the first volume).

Cognitive Radio Systems Gale Cengage

The History of Television, 1942 to 2000

American Library Association

Nikkei Microdevices' 2006 report on flat panel display (FPD) industry includes:

- Exclusive in-depth interviews with 28 top executives in the industry
- Over 250 information-

packed figures, tables and pictures -Proprietary intelligence not available anywhere else In 2006, competitive conditions in the flat panel display (FPD) industry will change significantly. The era in which competition was primarily based on increasing investment and glass substrate sizes is over. Henceforth, overall capability, including parts/material strategy and equipment strategy, will become the decisive factor. By 2010, parts and material costs will account for 80% of the total cost of large-size LCD panels, which will drive future market expansions; thus, parts and materials will make up most of the value addition in panels. Leading panel makers are starting to reinforce their cooperative relationships with parts and material makers, as well as with equipment makers.

New Developments in

Liquid Crystals McFarland Liquid crystal technology is a subject of many advanced areas of science and engineering. It is commonly associated with liquid crystal displays applied in calculators, watches, mobile phones, digital cameras, monitors etc. But nowadays

liquid crystals find more and more use in photonics, telecommunications, medicine and other fields. The goal of this book is to show the increasing importance of liquid crystals in industrial and scientific applications and inspire future research and engineering ideas in students, young researchers and practitioners.

Encyclopedia of Major Marketing Campaigns

We live in the silicon age, and the quintessential item that defines our world is the computer. Silicon chips power the computer as well as many other products for work and leisure, such as calculators, radios, and televisions. In the forty years since the transistor was invented, the solid state revolution has affected the lives of almost everyone in the world. Based on silicon, solid state devices and integrated circuits have revolutionized electronics, data processing, communications, and the like. The computer, especially the personal computer, would be impossible without silicon devices. Only one computer was ever built using vacuum tubes, and the tubes had to be constantly replaced because they generated too much heat and burned out. Silicon devices allowed for reliable switching operations in arrays of hundreds and thousands of discrete

devices. As a result, the very substantial industrial base that existed for producing vacuum tubes disappeared -with one exception. That exception is, of course, the CRT, which is evident in televisions, computer displays, and a host of other information display terminals. Until recently, there was nothing that could take its place, and it seemed that the CRT would remain as the electronic medium for all except the simplest displays. The CRT is about to go the way of the other vacuum tubes. It's dead, but doesn't know it yet.
