The theoretical valve timing diagram for a four-stroke cycle engine is shown In this diagram, the inlet valve opens at A and the suction takes place from A to B. The crankshaft revolves through 180° and the piston moves from T.D.C. to B.D.C. At B, the inlet valve closes and the compression takes place from B to C.

The diagram shows the timing of opening and closing of intake and exhaust valve during one complete cycle of four strokes. The valve timing is one of the important factors that affect the volumetric efficiency of the engine. Both intake and exhaust valves are precisely timed to give a most satisfactory result for normal operating conditions.

7 Theoretical valve timing diagram for four stroke cycle engine • Now the piston reaches BDC and then starts moving up, thus performing the exhaust stroke. The inlet valve opens before the piston reaches TDC to start suction stroke. This is done as the fresh incoming charge helps in pushing out the burnt gases. Now the piston again reaches TDC, and the suction stroke starts.

Valve timing diagram shows the opening and closing of inlet and exhaust valve according to the 4 strokes of engines or we can simply say according to the two revolution of crankshaft. It is clearly shown in the diagram that inlet valve opens 25 degree before TDC (Top dead center - top edge of the cylinder) and inlet valve closes

after suction stage ends i.e 30 degree after BDC.
