National-level spatial planning in democratic countries has been all but ignored by researchers in urban and regional planning since the reconstruction years following World War II. Being synonymous for many with repressive regimes and coercive government practices, national-level planning also fell into some disrepute. A set of specially commissioned papers from leading researchers has produced this challenging and comprehensive study of current national-level planning in ten countries of the developed world. Challenging common assumptions, this comparative international study finds that there seems to be a modest trend whereby, on the threshold of the 21st century, national-level planning has grown in importance in democratic, advanced-economy countries.

In 1925, J. B. Collip (1925) reported that extracts of parathyroid gland contained an activity that raised calcium levels in the blood of parathyroidectomized animals, and suggested that this was due to a hormone produced in the parathyroid gland. The story of parathyroid hormone discovery was indicative of ever-increasing sophistication in sample preparation and protein isolation techniques. This paper resolved earlier controversies over the function of the parathyroid glands and control of blood calcium. The year 1961 was a banner year for parathyroid research, in which the peptides parathyroid hormone and calcitonin were purified, and in which it was suggested that calcitonin could lower blood calcium (Copp and Cameron 1961). In 1982 it was discovered that in neurons the primary RNA transcript for calcitonin could be alternatively-spliced to give calcitonin gene-related peptide (CGRP), and shortly thereafter amylin (previously named islet amyloid polypeptide, IAPP) was identified and shown to have homology to CGRP. Since then a and b CGRP have been delineated and adrenomedullin and intermedin discovered, and this family of homologous peptides has emerged. This family of peptide hormones has a diverse and constantly expanding range of important physiologic functions, including regulation of blood calcium, vascular tension, feeding behavior and pain recognition.
