National-level spatial planning in democratic countries has been all but ignored by researchers in urban and regional planning since the reconstruction years following World War II. Being synonymous for many with repressive regimes and coercive government practices, national-level planning also fell into some disrepute. A set of specially commissioned papers from leading researchers has produced this challenging and comprehensive study of current national-level planning in ten countries of the developed world. Challenging common assumptions, this comparative international study finds that there seems to be a modest trend whereby, on the threshold of the 21st century, national-level planning has grown in importance in democratic, advanced-economy countries.

A common perception of global resource scarcity holds that it is inevitably a catalyst for conflict among nations; yet, paradoxically, incidents of such scarcity underlie some of the most important examples of international cooperation. This volume examines the wider potential for the experience of scarcity to promote cooperation in international relations and diplomacy beyond the traditional bounds of the interests of competitive nation states. The interdisciplinary background of the book 's contributors shifts the focus of the analysis beyond narrow theoretical treatments of international relations and resource diplomacy

to broader examinations of the practicalities of cooperation in the context of competition and scarcity. Combining the insights of a range of social scientists with those of experts in the natural and bio-sciences—many of whom work as ' resource practitioners ' outside the context of universities—the book works through the tensions between ' thinking/theory ' and ' doing/practice ', which so often plague the process of social change. These encounters with scarcity draw attention away from the myopic focus on market forces and allocation, and encourage us to recognise more fully the social nature of the tensions and opportunities that are associated with our shared dependence on resources that are not readily accessible to all. The book brings together experts on theorising scarcity and those on the scarcity of specific resources. It begins with a theoretical reframing of both the contested concept of scarcity and the underlying dynamics of resource diplomacy. The authors then outline the current tensions around resource scarcity or degradation and examine existing progress towards cooperative international management of resources. These include food and water scarcity, mineral exploration and exploitation of the oceans. Overall, the contributors propose a more hopeful and positive engagement among the world ' s nations as they pursue the economic and social benefits derived from natural resources, while maintaining the ecological processes on which they depend.

National-Level Spatial Planning in Democratic Countries American Radio Relay League (ARRL)
In 1925, J. B. Collip (1925) reported that extracts of parathyroid gland contained an activity that raised calcium levels in the blood of parathyroidectomized animals, and suggested that this was due to a hormone produced in the parathyroid gland. The story of parathyroid hormone discovery was indicative of ever-increasing sophistication in sample preparation and protein isolation techniques. This paper resolved earlier controversies over the function of the parathyroid glands and c- trol of blood calcium. The year 1961 was a banner year for parathyroid research, in which the peptides parathyroid hormone and calcitonin were purified, and in which it was suggested that calcitonin could lower blood calcium (Copp and Cameron 1961). In 1982 it was discovered that in neurons the primary RNA transcript for calcitonin could be alternatively-spliced to give calcitonin gene-related peptide (CGRP), and shortly thereafter amylin (previously named islet amyloid polyp- tide, IAPP)

was identified and shown to have homology to CGRP. Since then a and b CGRP have been delineated and adrenomedullin and intermedin discovered, and this family of homologous peptides has emerged. This family of peptide hormones has a diverse and constantly expanding range of important physiologic functions, including regulation of blood calcium, vascular tension, feeding behavior and pain recognition.
