In the Occupational Safety and Health Act of 1970, Congress declared that its purpose was to assure, so far as possible, safe and healthful working conditions for every working man and woman and to preserve our human resources. In this Act, the National Institute for Occupational Safety and Health (NIOSH) is

charged with recommending occupational safety and health standards and describing exposure concentrations that are safe for various periods of employment-including but not limited to concentrations at which no worker will suffer diminished health, functional capacity, or life expectancy as a result of his or her work experience. By means of criteria documents, NIOSH communicates these recommended standards to regulatory agencies (including the Occupational Safety and Health Administration [OSHA]) and to others in the

occupational safety and health community. Criteria documents provide the scientific basis for new occupational safety and health standards. These documents generally contain a critical review of the scientific and technical information available on the prevalence of hazards, the existence of safety and health risks, and the adequacy of control methods. In addition to transmitting these documents to the Department of Labor, NIOSH also distributes them to health professionals in academic institutions, industry, organized labor, public interest groups,

and other government agencies. In 1972, NIOSH published *Criteria for a Recommended Standard: Occupational Exposure to Noise*, which provided the basis for a recommended standard to reduce the risk of developing permanent hearing loss as a result of occupational noise exposure [NIOSH 1972]. NIOSH has now evaluated the latest scientific information and has revised some of its previous recommendations. The 1998 recommendations go beyond attempting to conserve hearing by focusing on preventing occupational noise-induced hearing loss (NIHL). This criteria document reevaluates and reaffirms the recommended exposure limit (REL) for occupational noise exposure established by the National Institute for Occupational Safety and Health (NIOSH) in 1972. The REL is 85 decibels, A-weighted, as an 8-hr time-weighted average (85 dBA as an 8-hr TWA). Exposures at or above this level are hazardous. By incorporating the 4000-Hz audiometric frequency into the definition of hearing impairment in the risk assessment, NIOSH has found an 8% excess risk of developing occupational noise-induced hearing loss (NIHL) during a 40-year lifetime exposure at the 85-dBA REL. NIOSH has also found that scientific evidence supports the use of a 3-dB exchange rate for the calculation of TWA exposures to noise. The recommendations in this document go beyond attempts to conserve hearing by focusing on prevention of occupational NIHL. For workers whose noise exposures equal or exceed 85 dBA, NIOSH recommends a hearing loss prevention program (HLPP) that includes exposure

assessment, engineering and administrative controls, proper use of hearing protectors, audiometric evaluation, education and motivation, recordkeeping, and program audits and evaluations. Audiometric evaluation is an important component of an HLPP. To provide early identification of workers with increasing hearing loss, NIOSH has revised the criterion for significant threshold shift to an increase of 15 dB in the hearing threshold level (HTL) at 500, 1000, 2000, 3000, 4000, or 6000 Hz in either ear, as determined by two consecutive

tests. To permit timely intervention and prevent further hearing losses in workers whose HTLs have increased because of occupational noise exposure, NIOSH no longer recommends age correction on individual audiograms. Small-Block Chevy Performance 1955-1996

CarTech Inc

GM LS-series engines are some of the most powerful, versatile, and popular V-8 engines ever produced. They deliver exceptional torque and abundant horsepower, are in ample supply, and

have a massive range of aftermarket parts available. Some of the LS engines produce about 1 horsepower per cubic inch in stock form--that's serious performance. One of the most common ways to produce even more horsepower is through forced air induction--supercharging or turbocharging. Right-sized superchargers and turbochargers and relatively easy tuning have grown to make supercharging or turbocharging an LS-powered vehicle a

comparatively simple yet highly effective method of generating a dramatic increase in power. In the revised edition of *How to Supercharge & Turbocharge GM LS-Series Engines*, supercharger and turbocharger design and operation are covered in detail, so the reader has a solid understanding of each system and can select the best system for his or her budget, engine, and application. The attributes of Roots-type and centrifugal-type superchargers as well as

turbochargers are extensively discussed to establish a solid base of knowledge. Benefits and drawbacks of each system as well as the impact of systems on the vehicle are explained. Also covered in detail are the installation challenges, necessary tools, and the time required to do the job. Once the system has been installed, the book covers tuning, maintenance, and how to avoid detonation so the engine stays healthy. Cathedral, square, and D-shaped port design heads are explained in terms of

performance, as well as strength and reliability of the rotating assembly, block, and other components. Finally, Kluczyk explains how to adjust the electronic management system to accommodate a supercharger or turbocharger. How to Supercharge and Turbocharge GM LS-Series Engines is the only book on the market specifically dedicated to forced air induction for LS-series engines. It provides exceptional guidance on the wide range of systems and

kits available for arguably the most popular modern V-8 on the market today.

[How to Rebuild Your Small-Block Chevy](#) California Bill's Automotive Handbooks

This is a true story of a city and its people, seemingly making a wrong turn on the road to a better life, and having to live it while hoping for change. The story reads like a B-Movie with high crime, political corruption, illicit sex and bank robberies, mixed with violence, mystery, myth and Indian lore. While laughable at times, the story profiles many of the people and the experiences associated with them, as abject lessons in

perseverance, faith and determination in overcoming adversities in their city. Desert Hot Springs is a historical place in the Imperial Desert of California high above the Desert floor identified today as Coachella Valley. The area, once roamed by the Cahuilla and Agua Caliente Indians, became home to Cabot Yerxa, one of the Valley's earliest known settlers in 1913, whose adobe house still stands as a museum and monument to the pioneering spirit of America. According to public records, the local Chamber of Commerce and Mission Springs

Water District, the area boasts some of the finest drinking water in the United States, and an abundance of underground mineral spring water rushing to the surface from 105 degrees to 125 degrees in 44 Boutique spas. It is also a place where local lore and some enthusiasts believe there is an "Energy Vortex" in the center of the city creating mystic powers for residents and visitors. Most early settlers of the area were homesteaders, who qualified and secured their 160-acre parcel ownership by constructing the required one-hundred square foot "home" as

established by the Homestead Act of the U.S. Government and signed by President Abraham Lincoln in 1862. The law took effect on January 1, 1863. Now, the city within its boundaries is financially, and infrastructure challenged. There is a small but very active constituency of citizens working as volunteers on civic projects throughout the city, many of whom believe the "natural wonders" of the medicinal quality of "miracle hot spring waters"; the pure drinking water and the "Energy Vortex" will bring prosperity to the city. So far, this hasn't

happened.
