These valves have a small amount of clearance between the valve itself and the mechanism that activates the valve. This clearance is called "lash." If the valve lash is set incorrectly (too much clearance, or not enough), the engine may respond by running rough at idle, particularly while warming up.

The valves are opened by cams or rocker arms on the camshaft, which push the valve's tappet, which forces the valve to open. If the clearance between the valve stem and the cam or rocker arm isn't perfect, the valve will open and close at the wrong time, or may not close all the way. Adjusting the valve clearance will resolve this issue.
