Chilton's Motorcycle Repair Manual Haynes

Manuals N. America, Incorporated

The chemokines family of small proteins are
involved in numerous biological processes
ranging from hematopoiesis, angiogenesis,
and basal leukocyte trafficking to the
extravasation and tissue infiltration of
leukocytes in response to inflammatory
agents, tissue damage, and bacterial or viral
infection. Chemokines exert their effects
through a family of seven G-protein coupled
transmembrane receptors. Worldwide interest
in the chemokine field surged dramatically
early in 1996, with the finding that certain
chemokine receptors were the elusive
coreceptors, required along with CD4, for HIV
infection. Today, though over 40 human
chemokines have been described, the number
of chemokine receptors lags behind—only 17
human chemokine receptors have been
identified so far. What has emerged over the

years is that most chemokine receptors bind
several distinct ligands, and indeed the
majority of chemokines are able to bind to
multiple chemokine receptors, explaining to
some extent the apparent disparity in the
numbers of chemokines and receptors. Yet in
spite of the apparent redundancy in
chemokine/chemokine receptor interactions, it
is clear that in vivo, spatial, temporal, and
indeed cell- and tissue-specific expression of
both chemokines and their receptors are im-
portant factors in determining the precise nature
of cellular infiltrates in physiological and
pathological processes.
