Over the last 30 years, water quality management in the United States has been driven by the control of

point sources of pollution and the use of effluent-based water quality standards. Under this paradigm, the quality of the nation's lakes, rivers, reservoirs, groundwater, and coastal waters has generally improved as wastewater treatment plants and industrial dischargers (point sources) have responded to regulations promulgated under authority of the 1972 Clean Water Act. These regulations have required

dischargers to comply with effluent-based standards for criteria pollutants, as specified in National Pollutant Discharge Elimination System (NPDES) permits issued by the states and approved by the U.S. Environmental Protection Agency (EPA). Although successful, the NPDES program has not achieved the nation's water quality goals of "fishable and swimmable" waters largely because discharges from other unregulated nonpoint sources of pollution have not been as successfully controlled. Today, pollutants such as nutrients and sediment, which are often associated with nonpoint sources and were not considered criteria pollutants in the Clean Water Act, are jeopardizing water quality, as are habitat destruction, changes in flow regimes, and introduction of exotic species. This array of challenges has shifted the focus of water quality management from effluent-based to ambient-based water quality standards. Given the most recent lists of impaired waters submitted to EPA, there are about 21,000 polluted river segments, lakes, and estuaries making up over 300,000 river and shore miles and 5 million lake acres. The number of TMDLs required for these impaired waters is greater than 40,000. Under the 1992 EPA guidance or the terms of lawsuit settlements, most states are required to meet an 8- to 13-year deadline for completion of TMDLs. Budget requirements for the program are staggering as well, with most states

claiming that they do not have the personnel and financial resources necessary to assess the condition of their waters, to list waters on 303d, and to develop TMDLs. A March 2000 report of the General Accounting Office (GAO) highlighted the pervasive lack of data at the state level available to set water quality standards, to determine what waters are impaired, and to develop TMDLs. This report represents the consensus opinion of the eight-member NRC committee assembled to complete this task. The committee met three times during a three-month period and heard the testimony of over 40 interested organizations and stakeholder groups. The NRC committee feels that the data and science have progressed sufficiently over

the past 35 years to support the nation's return to ambient-based water quality management. Given reasonable expectations for data availability and the inevitable limits on our conceptual understanding of complex systems, statements about the science behind water quality management must be made with acknowledgment of uncertainties. This report explains that there are creative ways to accommodate this uncertainty while moving forward in addressing the nation's water quality challenges.

During the 1930s in the
United States, the Works
Progress Administration
developed the Federal
Writers ' Project to support
writers and artists while
making a national effort to
document the country ' s
shared history and culture.
The American Guide series
consists of individual
guides to each of the
states. Little-known
authors—many of whom
would later become

celebrated literary
figures—were commissioned
to write these important
books. John Steinbeck, Saul
Bellow, Zora Neale
Hurst, and Ralph Ellison
are among the more than
6,000 writers, editors,
historians, and researchers
who documented this
celebration of local
histories. Photographs,
drawings, driving tours,
detailed descriptions of
towns, and rich cultural
details exhibit each state ' s
unique flavor. Montana, one
of the Great Plains states,
is finely portrayed in its
WPA guide. Originally
published in 1939, the spirit
of the Wild West shines
throughout this guide to the
Treasure State. During this
time period, the population
of Montana was rural and
cities small, with most of
the economy tied to the
land, mining, or cattle. With
10 hiking trails outlined for
Glacier National Park alone
and 18 driving tours
throughout the state, this

book is an excellent resource for history and nature buffs alike.
