This book constitutes the proceedings of the 8th International Conference on Higher Order Logic Theorem Proving and Its Applications, held in Aspen Grove, Utah, USA in September 1995. The 26 papers selected by the program committee for inclusion in this volume document the advances in the field achieved since the predecessor conference. The papers presented fall into three general categories: representation of formalisms in higher order logic; applications of mechanized higher order logic; and enhancements to the HOL and other theorem proving systems. In Transcultural Joyce, a team of leading international scholars assess the afterlife of James Joyce and his writings within a multinational context. How does Joyce haunt the works of later writers in diverse literary traditions? How well does he translate from one culture and language to another? This book consider Joyce's reincarnations in texts from Latin America, Europe, and South Asia. Transcultural Joyce provides a fresh theoretical examination of conventional notions such as 'influence' and 'translation' and asks how Joyce is imported across particular cultural boundaries. As a canonical modernist and colonial subject, Joyce inhabits a borderline position that complicates his reception and revision by later writers. This book accounts for his cultural place as specifically Irish and more postcolonial than previous studies have acknowledged. Scholars and translators of Joyce also consider the formidable task of translating his work for a global audience.

This volume presents the proceedings of the 7th International Workshop on Higher Order Logic Theorem Proving and Its Applications held in Valetta, Malta in September 1994. Besides 3 invited papers, the proceedings contains 27 refereed papers selected from 42 submissions. In total the book presents many new results by leading researchers working on the design and applications of theorem provers for higher order logic. In particular, this book gives a thorough state-of-the-art report on applications of the HOL system, one of the most widely used theorem provers for higher order logic.

Offers essays demonstrating the critical relevance of Irigaray's thought of sexual difference for addressing contemporary ethical and social issues. Engaging the World explores Luce Irigaray's writings on sexual

difference, deploying the resources of her work to rethink philosophical concepts and commitments and expose new possibilities of vitality in relationship to nature, others, and to one's self. The contributors present a range of perspectives from multiple disciplines such as philosophy, literature, education, evolutionary theory, sound technology, science and technology, anthropology, and psychoanalysis. They place Irigaray in conversation with thinkers as diverse as Charles Darwin, Claude Lévi-Strauss, Gilles Deleuze, René Decartes, and Avital Ronell. While every essay challenges Irigaray's thought in some way, each one also reveals the transformative effects of her thought across multiple domains of contemporary life. Mary C. Rawlinson is Professor of Philosophy and Comparative Literature at Stony Brook University, State University of New York. She is the coeditor (with Ellen K. Feder and Emily Zakin) of *Derrida and Feminism: Recasting the Question of Woman* and (with Sabrina L. Hom and Serene J. Khader) of *Thinking with Irigaray*, also published by SUNY Press.

"Dark Skies is the first work to assess the full impacts of space expansion, past, present and future. Thinking about space, and the visions fervently promoted by the global space movement, are dominated by geographic misperceptions and utopian illusions. The parts of space where almost all activity has occurred are part of the planet Earth, its astrosphere, and are, in practical terms, smaller than the atmosphere. Contrary to frontier visions, orbital space is already congested and degraded with dangerous space debris. The largest impact of actual space activities is an increased likelihood of catastrophic nuclear war stemming from the use of orbital space and space technology to lob nuclear weapons at intercontinental distances. Building large-scale orbital infrastructures will probably require or produce world government. The ultimate goal of space advocates, the colonization of Mars and asteroids, is promoted to guarantee the survival of humanity if major catastrophes strike Earth. But the spread of humanity into a multi-planet species will likely produce an interstate anarchy highly prone to total war, with Earth having many disadvantages. Altering the orbits of asteroids, a readily achievable technology vital for space colonization, also makes possible 'planetoid bombs' with destructive potentials millions of times great than all nuclear weapons. The biological diversification of humanity into multiple species, anticipated by space advocates, will further stoke interworld wars. Astroicide - the extinction of humanity resulting from significant space expansion - must join the lengthening list of potential threats to human survival. Large-scale space expansion should be relinquished in favour of an Earth-oriented space program of arms control and planetary security.
