Published in two volumes, this new book, *Advances in Sustainable Development and Management of Environmental and Natural Resources: Economic Outlook and Opinions*, addresses the varied aspect of natural resources and their management in conjunction with socioeconomic aspects. With chapters from authors from around the world, this volume features 24 chapters that cover many aspects of the sustainable utilization of management of natural resources and provides new insight into the nexus of ecology and economy and their application in various fields of science. The chapters include case studies and research from India, Africa, South America, and elsewhere. After first laying the foundation, the volume goes on to discuss sustainable development and natural resource management from an economics point of view. Chapters address myriad issues involved in natural resources and environmental management, including soil and water resources management in arid lands, resource management for agricultural purposes, contemporary global legal norms of environment and sustainable development, how emissions factor into regional economies, mitigation of the impact of climate change through sustainable practices, rainwater harvesting technology, and much more. The chapters include case studies that discuss soil, agroforestry, agriculture, wetlands, and floral diversity. The book provides a solid foundation for a realistic perspective of the role of sustainable development and management of natural resources while taking the socioeconomic impact into consideration as well. It will be a valuable resource and reference for the study of ecology, economics, sustainable development, natural resource management, and other allied fields.

Nature has provided every creature that roams the earth a diet designed to sustain and maximize its life. What these diets are composed of is based on a creature ' s location, climate, accessibility, and physical prowess. As humans, our ancient forefathers—and mothers—were raised and nourished in the same manner as the beasts that surrounded them. These Stone Age diets, now called Paleo diets, reflect the types of foods that nature intended us to eat. Unfortunately, we have lost touch with how nature intended us to live and mistakenly think we can eat anything sitting on our supermarket shelves. *Paleo in a Nutshell* is an eye-opening guide to restoring our health by eating the foods for which our bodies are designed to consume. Author Geoff Bond is a world-renowned scientist who has extensively researched forager societies of the past and present. What he has discovered is that our hunter-gatherer ancestors had never experienced the health disorders that plague us today. This is because their diets, environments, and daily activities were far more in touch with their bodies than our way of life today. Although our diet has become our most dysfunctional feature, other aspects of the Paleo lifestyle are essential to explore as well. In Part One of this book, we learn how and why our ancestors thrived and explore how things went

wrong when we stopped behaving in agreement with our evolutionary past. In Part Two, we are provided with an “ Owner ’ s Manual ” —a guide to appropriate and healthy foods with which to fuel our bodies—and a step-by-step plan for implementing this way of eating. While you may no longer have time to hunt and forage for your food, this book offers modern and simple substitutions for you to use, as well as several delicious recipes. Written in simple-to-understand language, Paleo in a Nutshell is all you need to find your way back to a healthier and more natural way of living.

This book presents various aspects of agroforestry research and development, as well as the latest trends in degraded landscape management. Over the last four decades, agroforestry research (particularly on degraded landscapes) has evolved into an essential problem-solving science, e.g. in terms of sustaining agricultural productivity, improving soil health and biodiversity, enhancing ecosystem services, supporting carbon sequestration and mitigating climate change. This book examines temperate and tropical agroforestry systems around the world, focusing on traditional and modern practices and technologies used to rehabilitate degraded lands. It covers the latest research advances, trends and challenges in the utilization and reclamation of degraded lands, e.g. urban and peri-urban agroforestry, reclamation of degraded landscapes, tree-based multi-enterprise agriculture, domestication of high-value halophytes, afforestation of coastal areas, preserving mangroves and much more. Given its scope, the book offers a valuable asset for a broad range of stakeholders including farmers, scientists, researchers, educators, students, development/extension agents, environmentalists, policy/decision makers, and government and non-government organizations.

With an increasing number of people suffering from obesity, heart disease, and other diet-related disorders, many of us turn to fad diets in an effort to drop excess pounds or recover our health. But what if our foods were doing more harm than good, and fad diets made matters worse? Deadly Harvest examines how the foods we eat today have little in common with those of our ancestors, and why this fact is important to our health. It also offers a proven program to enhance health and improve longevity. Using the latest scientific research and studies of primitive lifestyles, the author first explains the diet that our ancestors followed--one in harmony with the human species. He then describes how our present diets affect our health, leading to disorders such as cancer, diabetes, heart disease, and more. Most important, he details measures we can take to improve our diet, our health, and our quality of life.

Savanna and grassland biomes cover more of the earth's surface than any other biome type, and yet they are still largely understudied. In recent decades, global savanna and grassland ecosystems have become more prominent in the literature focused on global change dynamics. Savanna and grasslands represent unique biomes with their own challenges, both in terms of their study and in terms of their complexity, leading to many contradictory and often controversial findings. The global threats to these systems are potentially significant, from climate change impacts to human management challenges, from possible degradation to complete desertification, which vary across disturbance regime shifts. This Special Issue of Applied Sciences, “ Dynamics of Global Savanna and Grassland Biomes ” , is intended for a wide and interdisciplinary audience, and covers recent advances in: - drivers of vegetation dynamics - further understanding carbon interactions in these critical landscapes - advances in modeling both current and future system states - tipping points in savanna systems - human-environment interactions and challenges for management - biodiversity and ecosystem services

With Africa's water resources constantly threatened by an increasing population and the resultant rise in water demand, together with the stresses of water use for various activities, desertification, climate change, and other interventions in the water cycle by man, it is vital that the water resources in arid and semi-arid regions are developed a

Many endangered species of wild animals are managed in captivity through studbooks. In this book these data-rich resources are mined in innovative, integrated and statistically tested ways to maximise information gain for conservation practice – whether for captive or released/reintroduced or managed wild populations. This book is thus an important tool for all species managers, and for students and researchers in small population biology and wildlife conservation. The book's studbook analyses are grouped in three interrelated sections: natural history, demography and genetics. Statistical tests to determine the significance of results or to compare results between subgroups are undertaken throughout. Real studbooks of a variety of species, e.g. cranes, wolverines, blesbok, illustrate the practical applications and interpretations of the analyses and statistics. The “ natural history ” section presents analyses to determine baseline species information such as litter size, inter-birth interval, longevity and seasonality.

“ Demography ” covers census(-style) analyses, age-class based life tables, comparative survival analyses and population projections. Solutions for dealing with small sample sizes are included. Inbreeding depression and unconscious selection form the main focus of the “ genetics ” section. Survival and life table analyses are used to assess inbreeding effects.

Quantitative genetics methods are applied to natural history traits as a tool to monitor genetic variation. A fourth section on “ conservation ” shows how data from captive populations can be used where natural history data from wild populations are missing. A real example uses studbook data to inform Population Viability Analysis. The final section deals with issues related to incomplete and missing data and statistical topics. The purpose-written open-source software programs “ Population Management Library (PML) ” and “ studbookR ” used for analyses in the book, are available at www.princee.com.

Advances in Sustainable Development and Management of Environmental and Natural Resources

Forests are important for carbon sequestration and how they are manipulated either through natural or human induced disturbances can have an effect on CO2 emissions and carbon sequestration. The 2009 National Silviculture Workshop presented scientific information and management strategies to meet a variety of objectives while simultaneously addressing carbon sequestration and biomass utilization. The focus areas were: the role of climate change in science and management; silvicultural methods to address carbon sequestration and biomass utilization; alternative silvicultural strategies to address the growth and development of forests; and current applications of computer simulation models or modeling techniques designed to provide decision support.

Measuring and Monitoring Biological Diversity is the first book to provide comprehensive coverage of standard methods for biodiversity sampling of amphibians, with information on analyzing and using data that will interest biologists in general. In this manual, nearly fifty herpetologists recommend ten standard sampling procedures for measuring and monitoring amphibian and many other populations. The contributors discuss each procedure, along with the circumstances for its appropriate use. In addition, they provide a detailed protocol for each procedure's implementation, a list of necessary equipment and personnel, and suggestions for analyzing the data. The data obtained using these standard methods are comparable across sites and through time and, as a result, are extremely useful for making decisions about habitat protection, sustained use, and restoration—decisions that are particularly relevant for threatened amphibian populations.
