Various combinations of commercially available technologies could greatly reduce fuel consumption in passenger cars, sport-utility vehicles, minivans, and other light-duty vehicles without compromising vehicle performance or safety. Assessment of Technologies for Improving Light Duty Vehicle Fuel Economy estimates the potential fuel savings and costs to consumers of available technology combinations for three types of engines: spark-ignition gasoline, compression-ignition diesel, and hybrid. According to its estimates, adopting the full combination of improved technologies in medium and large cars and pickup trucks with spark-ignition engines could reduce fuel consumption by 29 percent at an additional cost of \$2,200 to the consumer. Replacing spark-ignition engines with diesel engines and components would yield fuel savings of about 37 percent at an added cost of approximately \$5,900 per vehicle, and replacing spark-ignition engines with hybrid engines and components would reduce fuel consumption by 43 percent at an increase of \$6,000 per vehicle. The book focuses on fuel consumption—the amount of fuel consumed in a given driving distance—because energy savings are directly related to the amount of fuel used. In contrast, fuel economy measures how far a vehicle will travel with a gallon of fuel. Because fuel consumption data indicate money saved on fuel purchases and reductions in carbon dioxide emissions, the book finds that vehicle stickers should provide consumers with fuel consumption data in addition to fuel economy information.

The test pilot and author of Nimrod Rise and Fall shares a collection of over twenty tales from the cockpit of Nimrod aircraft during the Cold War. As the first jet-powered maritime aircraft, the Hawker Siddeley Nimrod could reach critical points for rescues or for operational requirements in rapid time. Its outstanding navigation and electronics systems also allowed the Nimrod to be a first-class machine in antisubmarine warfare. In Nimrod Boys, author and pilot Tony Blackman offers vivid, firsthand accounts of the Nimrod's UK-based and worldwide operations. The stories in this volume range from the Nimrod's role during the Falklands Campaign and the First Gulf War to more recent anti-drug smuggling operations in the Caribbean. There are also descriptions of the Nimrod's achievements in the International Fincastle Competition—where Royal Air Force squadrons competed against counterparts from Australia, Canada and New Zealand. With a variety of perspectives on Nimrod crew life, including from a female air electronic operator, readers will find dramatic, engaging and occasionally humorous stories. One flight test observer also reflects on the canceled Nimrod MR4 project.

Present military concepts call for highly mobile units capable of rapid dispersal and efficient movement across country where no roads exist, and many current civilian engineering tasks require movement of men and materials long distances over roadless terrain. Oversnow transport is a particular aspect of the general problem of cross-country mobility, but the characteristics of snow-covered regions are such that special techniques and equipment are required for efficient operation. In order to fully understand the action of vehicles in snow and to formulate sound design criteria, it is necessary to develop a theory which permits quantitative analysis of trafficability problems. For practical purposes, vehicle evaluation is at present made from the results of relatively simple field tests which give drawbar pull as their main indicator. The best practical evaluations are made by observing the operational capabilities of vehicles in various types of snow.
