Answer: the number of bridges. Euler proved the number of bridges must be an even number, for example, six bridges instead of seven, if you want to walk over each bridge once and travel to each part of Königsberg. Graph Theory: 01. Seven Bridges of Königsberg

There are five bridges that lead to A, so it needs to be used three times in the eight-letter solution he's looking for. B, C, and D all have two bridges that lead to them, so they each need to appear twice. But $3 + 2 + 2 + 2$ is 9, not 8, even though you must land on only eight landmasses for seven bridges.
