This book, first published in 1987, is about the classic free will problem, construed in terms of the implications of moral responsibility. The principal thesis is that the core issue is metaphysical: can scientific laws postulate objectively necessary connections between an action

---

and its causal antecedents? The author concludes they cannot, and that, therefore, free will and determinism can be reconciled.

Since the revolution of 1979, scholars have portrayed the Islamic State's industrial development capacity in a negative light. Global isolation, incoherent economic planning, and

---

predatory Islamic institutions are often cited as the reasons for lackluster development. In *Iran Auto: Building a Global Industry in an Islamic State*, Darius Mehri shows how this characterization is misguided. Today, Iran has one of the world's largest automobile industries with national technical capacity. Previous studies ignore the consequences of three decades of Iran's capacity for successful industrialization and changes in global technology transfer that allow countries, even ones isolated from formal global institutions, to build an automobile industry. Mehri shows how industrial nationalists in Iran constructed a network of politically effective

relationships to open up space for successful local industrial development, and then tapped into a set of important global linkages to create an industry with high local manufacturing content. This book will open up a new line of inquiry into how countries in the global south can develop a successful national automobile industry without the need to conform to global economic institutions.

Machining is an essential part of high-performance engine building and stock rebuilding, as well as certain servicing procedures. Although you may not own the expensive tooling and machining to perform all or any of the machining required for a quality build, you need to understand the principles, procedures, and goals for machining, so you can guide the machining process when outsourced. Classic and older engines typically require extensive machining and almost every major component of engine, including block, heads, intake, crankshaft, and pistons, require some sort of machining and fitment. A detailed, authoritative, and thorough automotive engine-machining guide for the hard-core enthusiast has not been available

until now. Mike Mavrigian, editor of Engine Building Professional, walks you through each important machining procedure. A stock 300-hp engine build has far different requirements than a 1,000-hp drag race engine, and Mavrigian reveals the different machining procedures and plans according to application and engine design. The author also shows you how to inspect, measure, and evaluate components so you can provide astute guidance and make the best machine work choices. Machining procedures included are cylinder boring, align boring/honing, decking, valveseat cutting, cam tunnel boring, and a multitude of other services. In addition, multi-angle valve jobs, setting the valveseats, altering rocker arm ratio, re-conditioning connecting rods, and machining and matching valvetrain components are also covered. Whether you're an enthusiast engine builder or prospective machining student who wants to pursue a career as an automotive

---

machinist, this book will provide insight and in-depth instruction for performing the most common and important machining procedures.

All the tools and the proper equipment required for automotive electrical tasks are covered. In addition, this in-depth guide explains how to perform more complex tasks, such as adding new circuits, installing aftermarket electronics, repairing existing circuits, and troubleshooting. It also explains how to complete popular wiring projects, such as adding late-model electronic

---

accessories and convenience items to earlier-model cars, installing relay systems, designing and assembling multi-function circuits and harnesses, and much more.
