Busses provides the necessary introduction to the

basic features and capabilities of a range of popular commercial busses. Its main objective is to prepare students in solving engineering problems using the concepts and materials featured in the book. The first three chapters introduce the basic concepts and principles such as basic bus and transmission-line concepts, comparative analysis of busses, and the process of how a program can give out hardware responses or operations on a bus. The middle section of the book delves more deeply into the different types of

computer busses and into the important features of the operation of each bus. The book supplements and simplifies these features. Lastly, the book concludes by illustrating design examples of existing sample boards that are produced commercially. This book serves as a valuable tool to engineering students. Systems engineers and design engineers can also use this book as reference in designing microcomputer-based systems or in developing system architecture.

Intended as the primary text for introductory courses on medical anthropology, this book integrates human biological data relevant to health and disease with both evolutionary theory and the social environments that more often than not produce major challenges to health and survival. Because students who take this fastest-growing anthropology course come from a variety of disciplines (anthropology, biology, especially pre-med students, and health sciences, especially), the text does not assume

anything beyond a basic high-school level familiarity with human biology and anthropology. The authors first present basic biological information on a particular health condition and then expand their analysis to include evolutionary, historical, and cross-cultural perspectives. Among the topics covered are nutrition, infectious disease, stress, reproductive health, behavioral disease, aging, race/racism and health, mental health, and healers and healing.
