Exactly 100 years ago in 1910 at Portello on the outskirts of Milan, a new company was established in the still young world of motoring of the period: Alfa Romeo. A name which, in those 100 years, has become synonymous with cars, so important has its presence been both on the industrial and sports fronts as well as culturally. In this long period of time, the celebrated Italian marque brought to life cars that have entered by right into the history of the automobile and not only that of Italy, like the 1900, the Giulietta and the Giulia. Yet at the same time the company was able to write its own unrepeatabe pages in the annuals of motor sport, winning all the most important races: from the Mille Miglia to Le Mans, from the Tourist Trophy to the World Sports Car Championship. An epic about which just almost everything has been written; but this volume by a great authority on the subject in Maurizio Tabucchi aims to be a tribute to this tremendous story, told above all by pictures, many of them previously unpublished, and supported by brief but exhaustive texts.

In the first book of its kind, Turnbull traces the development and implementation of actuarial ideas, from the conception of Equitable Life in the mid-18th century to the start of the 21st century. This book analyses the historical development of British actuarial thought in each of its three main practice areas of life assurance, pensions and general insurance. It discusses how new actuarial approaches were developed within each practice area, and how these emerging ideas interacted with each other and were often driven by common external factors such as shocks in the economic environment, new intellectual ideas from academia and developments in technology. A broad range of historically important actuarial topics are discussed such as the development of the blueprint for the actuarial management of with-profit business; historical developments in mortality modelling methods; changes in actuarial thinking on investment strategy for life and pensions business; changing perspectives on the objectives and methods for funding Defined Benefit pensions; the application of risk theory in general insurance reserving; the adoption of risk-based reserving and the Guaranteed Annuity Option crisis at the end of the 20th century. This book also provides an historical overview of some of the most important external contributions to actuarial thinking: in particular, the first century or so of modern thinking on probability and statistics, starting in the 1650s with Pascal and Fermat; and the developments in the field of financial economics over the third quarter of the twentieth century. This book identifies where historical actuarial thought heuristically anticipated some of the fundamental ideas of modern finance, and the challenges that the profession wrestled with in reconciling these ideas with traditional actuarial methods. Actuaries have played a profoundly influential role in the management of the United Kingdom ' s most important long-term financial institutions over the last two hundred years. This book will be the first to chart the influence of the actuarial profession to modern day. It will prove a valuable resource for actuaries, actuarial trainees and students of actuarial science. It will also be of interest to academics and professionals in related financial fields such as accountants, statisticians, economists and investment managers.

The triumphant return of a book that gave us permission to throw out the rulebook, in activities ranging from play to architecture to revolution. When this book first appeared in 1972, it was part of the spirit that would define a new architecture and design era—a new way of thinking ready to move beyond the purist doctrines and formal models of modernism. Charles Jencks and Nathan Silver's book was a manifesto for a generation that took pleasure in doing things ad hoc, using materials at hand to solve real-world problems. The implications were subversive. Turned-off citizens of the 1970s immediately adopted the book as a DIY guide. The word “ adhocism ” entered the vocabulary, the concept of adhocism became part of the designer's toolkit, and Adhocism became a cult classic. Now Adhocism is available again, with new texts by Jencks and Silver reflecting on the past forty years of adhocism and new illustrations demonstrating adhocism's continuing relevance. Adhocism has always been around. (Think Robinson Crusoe, making a raft and then a shelter from the wreck of his ship.) As a design principle, adhocism starts with everyday improvisations: a bottle as a candleholder, a dictionary as a doorstop, a tractor seat on wheels as a dining room chair. But it is also an undeveloped force within the way we approach almost every activity, from play to architecture to city planning to political revolution. Engagingly written, filled with pictures and examples from areas as diverse as auto mechanics and biology, Adhocism urges us to pay less attention to the rulebook and more to the real principle of how we actually do things. It declares that problems are not necessarily solved in a genius's “ eureka! ” moment but by trial and error, adjustment and readjustment.
