Let p be a prime and S a finite p -group. A p -fusion system on S is a category whose objects are the subgroups of S and whose morphisms are certain injective group homomorphisms. Fusion systems are of interest in modular representation theory, algebraic topology, and local finite group theory. The book provides a characterization of the 2-fusion systems of the groups of Lie type and odd characteristic, a result analogous to the Classical Involution Theorem for groups. The theorem is the most difficult step in a two-part program. The first part of the program aims to determine a large subclass of the class of simple 2-fusion systems, while part two seeks to use the result on fusion systems to simplify the proof of the theorem classifying the finite simple groups.

Roman Quaedvlieg was always destined to make a mark. As a rookie policeman on the mean streets of Fortitude Valley in the dying days of the Moonlight State, his first arrest was Brisbane's most wanted escapee. Three decades later, he found himself navigating through the corridors of power in Canberra. Tour de Force charts the years in between, during which he truly sees it all. From policing on the beat to going undercover with bikies and gangs, to eventually running covert operations at the Australian Crime Commission, exposing major drug importations while working in customs services and leading the operation to turn back boats on international waters. Right up to being appointed as the very first head of the Australian Border Force, Roman Quaedvlieg's story is one of a tough, resourceful and disciplined policeman rising through

the ranks to the very top of law enforcement in Australia. This is a personal and political story that exposes a deeply conflicted national security system and doesn't shy away from his notorious sacking from the top job. Tour de Force is a detailed and explosive memoir, revealing a lifelong quest for justice in the face of cronyism, unbridled ambition, politics and vested interests.

It was long ago that group analysis of differential equations became a powerful tool for studying nonlinear equations and boundary value problems. This analysis was especially fruitful in application to the basic equations of mechanics and physics because the invariance principles are already involved in their derivation. It is in no way a coincidence that the equations of hydrodynamics served as the first object for applying the new ideas and methods of group analysis which were developed by V. Ovsyannikov and his school. The authors rank themselves as disciples of the school. The present monograph deals mainly with group-theoretic classification of the equations of hydrodynamics in the presence of planar and rotational symmetry and also with construction of exact solutions and their physical interpretation. It is worth noting that the concept of exact solution to a differential equation is not defined rigorously; different authors understand it in different ways. The concept of exact solution expands along with the progress of mathematics (solutions in elementary functions, in quadratures, and in special functions; solutions in the form of convergent series with effectively computable terms; solutions whose searching reduces to integrating ordinary differential equations; etc.). We consider it justifiable to enrich the set of exact solutions with rank one and rank two in variant and partially invariant solutions to the equations of hydrodynamics.

The book covers a broad range of topics which are in the focus of contemporary singularity theory. Its idea emerged during two Singularities workshops held at the University of Lille (USTL) in 1999 and 2000. Due to the breadth of singularity theory, a single volume can hardly give the complete picture of today's progress. Nevertheless, this collection of papers provides a good snapshot of what is the state of affairs in the field, at the turn of the century. Several papers deal with global aspects of singularity theory. Classification of families of plane curves with prescribed singularities were among the first problems in algebraic geometry. Classification of plane cubics was known to Newton and classification of quartics was achieved by Klein at the end of the

19th century. The problem of classification of curves of higher degrees was addressed in numerous works after that. In the paper by Artal, Carmona and Cogolludo, the authors describe irreducible sextic curves having a singular point of type A_n ($n > 15$) and a large (Le., ≥ 18) sum of Milnor numbers of other singularities. They have discovered many interesting properties of these families. In particular they have found new examples of so-called Zariski pairs, i. e.
