B2B Customer Experience shows readers how to deliver the very best customer experience (often referred to as CX), within the business-to-business realm. Marketers have long known that emotions are important in driving our experiences, and the subject is now high on the agenda of B2B companies who want to deliver a 'wow' to their customers. Achieving this 'wow' factor helps organizations distinguish themselves from their competition, while simultaneously winning new business and retaining existing clients. B2B Customer Experience is the essential handbook that guides the reader

through the process of creating an exceptional customer experience. Intensely practical in its approach, B2B Customer Experience is divided into five parts to walk readers through the journey of planning, mapping, structuring, implementing and controlling an effective customer experience, all bespoke for the B2B environment. Clearly argued and supported by real-world examples, this text will help readers understand critical features including the difference between customer experience, loyalty and inertia; how to use journey maps to establish strengths and weaknesses in an organization, and how to ensure that sales teams are engaged in the customer experience programme. Discussing some of the best known examples of consumer-focused customer experiences from companies such as Zappos, Nordstrom and John Lewis, B2B Customer Experience is the must-have text for any marketing professional working within a B2B environment.

It was long ago that group analysis of differential equations became a powerful tool for studying nonlinear equations and boundary value problems. This analysis was especially fruitful in application to the basic equations of mechanics and physics because the invariance principles are already involved in their derivation. It is in no way a coincidence that the equations of hydrodynamics served as the first object for applying the new ideas and methods of group analysis which were developed by 1. V. Ovsyannikov and his school. The authors rank themselves as disciples of the school. The present monograph deals mainly with group-theoretic classification of the equations of hydrodynamics in the presence of planar and rotational symmetry

and also with construction of exact solutions and their physical interpretation. It is worth noting that the concept of exact solution to a differential equation is not defined rigorously; different authors understand it in different ways. The concept of exact solution expands along with the progress of mathematics (solutions in elementary functions, in quadratures, and in special functions; solutions in the form of convergent series with effectively computable terms; solutions whose searching reduces to integrating ordinary differential equations; etc.). We consider it justifiable to enrich the set of exact solutions with rank one and rank two invariant and partially invariant solutions to the equations of hydrodynamics.

Applications of Group-Theoretical Methods in Hydrodynamics Lloyd's Register

The collection of papers in this volume represents recent advances in the understanding of the geometry and topology of singularities. The book covers a broad range of topics which are in the focus of contemporary singularity theory. Its idea emerged during two Singularities workshops held at the University of Lille (USTL) in 1999 and 2000. Due to the breadth of singularity theory, a single volume can hardly give the complete picture of today's progress. Nevertheless, this collection of papers provides a good snapshot of what is the state of affairs in the field, at the turn of the century. Several papers deal with global aspects of singularity theory. Classification of families of plane curves with prescribed singularities were among the first problems in algebraic geometry. Classification of plane cubics was known to Newton and classification of quartics was achieved by Klein at the end of the 19th century. The

problem of classification of curves of higher degrees was addressed in numerous works after that. In the paper by Artal, Carmona and Cogolludo, the authors describe irreducible sextic curves having a singular point of type A_n ($n > 15$) and a large (Le. , :::: 18) sum of Milnor numbers of other singularities. They have discovered many interesting properties of these families. In particular they have found new examples of so-called Zariski pairs, i. e.

Let p be a prime and S a finite p -group. A p -fusion system on S is a category whose objects are the subgroups of S and whose morphisms are certain injective group homomorphisms. Fusion systems are of interest in modular representation theory, algebraic topology, and local finite group theory. The book provides a characterization of the 2-fusion systems of the groups of Lie type and odd characteristic, a result analogous to the Classical Involution Theorem for groups. The theorem is the most difficult step in a two-part program. The first part of the program aims to determine a large subclass of the class of simple 2-fusion systems, while part two seeks to use the result on fusion systems to simplify the proof of the theorem classifying the finite simple groups.
