SUSTAINABLE ENERGY focuses directly on energy related issues and includes a thorough treatment of all potentially viable energy sources. In most cases, individual chapters are devoted to each alternative energy approach. Although author Richard Dunlap covers past and current energy production methods, the text deals largely with future alternative energy strategies and follows the guidelines of ABET, the major engineering accreditation body. The book approaches these topics on a rigorous level -- familiarity with the basic concepts of freshman Physics and Chemistry is needed. The book contains enough material for a typical one semester course. The end-of-chapter problems are predominantly quantitative in nature. However, most are not straight forward calculations based on substituting values from the chapter in to the appropriate formula. The problems are designed to require the students to analyze information, to make use of material from previous chapters, to correlate data from various sources (not only from the textbook itself but from library, internet or other sources) and in many cases to estimate quantities based on interpretation of graphical data, interpolation of values and sometime just plain common sense. While maintaining a quantitative approach to the study of energy in our society, the text and accompanying problems show that this is a complex and very interdisciplinary topic. This approach is intended to provide students with an appreciation for the real problems that are encountered in the understanding of how we produce and use energy, and the realization that, while exact calculations are important and necessary, a broadly based analysis is often most appropriate. People are inseparable from natural ecosystems, and understanding how people think about, experience, and interact with nature is crucial for promoting environmental sustainability as well as human well-being. This is the new edition of what is now the leading textbook in conservation psychology, the field that explores connections between the study of human behavior and the achievement of conservation goals. Completely updated, this book summarizes theory and research on ways in which humans experience nature; it explores people ’ s conceptions of nature and environmental problems, their relationship with nature, and their moral lenses on nature; and examines ways to encourage conservation-oriented behavior at both individual and societal levels. Throughout, the authors integrate a wide body of research demonstrating the role of psychology in promoting a more sustainable relationship between humans and nature. New sections cover human perceptions of environmental problems, new examples of community-based conservation, and a

“ positive psychology ” perspective that emphasizes the relevance of nature to human resilience. Additional references are to be found throughout this edition along with some new examples and a reorganisation of chapters in response to reader feedback. This fascinating volume is used for teaching classes to senior undergraduate and graduate students of Conservation Psychology, Environmental Psychology and Conservation Science in departments of Psychology, Geography, Environmental Science, and Ecology and Evolution. It is equally suitable as a starting point for other researchers and practitioners - psychologists, conservation biologists, environmental scientists, and policy-makers - needing to know more about how psychological research can inform their conservation work.
