Undetected human error in aircraft maintenance creates a latent error condition that can contribute to undesirable outcomes. Individual Latent Error Detection (I-LED) acts as an additional system safety control that helps an engineer recall past errors through environmental cues. This book addresses a gap in the human factors research and current

safety strategies by exploring the nature and extent of I-LED and its benefit to safety resilience. The book will describe the I-LED concept using a systems perspective and propose practical interventions to be integrated within existing safety systems as an additional control to enhance resilience against human performance variability. This book is developed using material and pilot training notes including official Airbus FCOM, FCTM and the QRH to allow Pilots

to study as a refresher or prepare for their command upgrade. It covers failure management, ECAM, Airbus memory item drills, complex and demanding failures, technical reviews on systems, limitations, low visibility procedures, RVSM/PBN, MEL/CDL and supplementary information covering cold weather and icing, windshears, weather and wake turbulence. The memory item drills include: Loss of braking, Emergency descent, Stall recovery, Stall warning at lift-off, Unreliable airspeed, GPWS/EGPWS

warnings and cautions, TCAS warnings and Windshears. The complex and demanding failure chapter goes in depth with failures such as: Dual Bleed faults, Smoke/Fumes cases, Dual FMGC failure, Engine malfunctions of all levels, Fuel leak, Dual Hydraulic faults, Landing gear problems, Rejected takeoff and evacuation, Upset preventions and much more. Technical revision gives a good study highlight for all the Airbus A320 systems including Air conditioning, Ventilation and

Pressurisation, Electrical, Hydraulics, Flight-Controls and Automation, Landing gear, Pneumatics, etc. The later chapters of the book covers useful topics such as aircraft limitations, low visibility procedures, RVSM/PBN, MEL, CDL and other supplementary information such as cold weather and icing, turbulence and windshears in more detail. The book will no doubt be a great asset to any trainee or existing Airbus Pilot for both revision and training purposes including refresher training.

An Industrial Approach William Palmer
Welcome to the most complete manual about the MCDU operations based on the FMS system of the great A320. This manual describes all functions of the MCDU (Multi-Function Control and Display Unit) for Airbus A320 including definitions, normal operations and abnormal operations in real flights. Learn all about each part of the MCDU, each key, each function and every detail you need as a pilot. After learning the all theory concepts, you will learn to operate the MCDU in different flights, including domestic flights, international

flight and abnormal flights with emergencies. At the end of this book, you will be ready for operating the MCDU like a professional pilot.

This book provides a comprehensive basics-to-advanced course in an aero-

thermal science vital to the design of engines for either type of craft. The text classifies engines powering aircraft and single/multi-stage rockets, and derives performance parameters for both from basic aerodynamics and thermodynamics laws. Each type of engine is analyzed for optimum performance goals, and mission-appropriate engines selection is explained. *Fundamentals of Aircraft and Rocket Propulsion* provides information about and analyses of: thermodynamic cycles of shaft engines (piston, turboprop, turboshaft and propfan); jet engines (pulsejet, pulse detonation engine,

ramjet, scramjet, turbojet and turbofan); chemical and non-chemical rocket engines; conceptual design of modular rocket engines (combustor, nozzle and turbopumps); and conceptual design of different modules of aero-engines in their design and off-design state. Aimed at graduate and final-year undergraduate students, this textbook provides a thorough grounding in the history and classification of both aircraft and rocket engines, important design features of all the engines detailed, and particular consideration of special aircraft such as unmanned aerial and short/vertical takeoff and

landing aircraft. End-of-chapter exercises make this a valuable student resource, and the provision of a downloadable solutions manual will be of further benefit for course instructors.

Individual Latent Error Detection (I-LED) Springer A320 Easy is a study guide for A318, A319, A320 and A321 pilots. It's an easy manual published in english to review and help you learning the main A320 procedures, systems, task sharing, memory items, limitations, and the main knowledge for an interview. It can also be useful as an

aid for type rating course on Airbus A320 Family. - Interesting facts about A320F - General Information - Normal Procedures - Normal Checklists - FMGS Preparation - Briefing - A320 Systems - A320 Engine Types - Abnormal Procedures - MEL / CDL - Memory Items - Upset Recovery - Flight Crew Incapacitation - Discontinued Approach - Engine Failure During Cruise - Electrical Emergency Configuration - Emergency Evacuation - Emergency Equipment - Fuel Leak and Fuel

This open access book comprehensively covers the fundamentals of clinical data science, focusing on data collection, modelling and clinical applications. Topics covered in the first section on data collection include: data sources,

data at scale (big data), data stewardship (FAIR data) and related privacy concerns. Aspects of predictive modelling using techniques such as classification, regression or clustering, and prediction model validation will be covered in the second section. The third section covers aspects of (mobile) clinical decision support systems, operational excellence and value-based healthcare. *Fundamentals of Clinical Data Science* is an

essential resource for healthcare professionals and IT consultants intending to develop and refine their skills in personalized medicine, using solutions based on large datasets from electronic health records or telemonitoring programmes. The book's promise is "no math, no code" and will explain the topics in a style that is optimized for a healthcare audience.

This edited textbook is a fully updated and expanded version of the highly successful first edition of *Human Factors in Aviation*. Written for the widespread aviation community - students, engineers, scientists, pilots, managers, government personnel, etc., HFA offers a comprehensive overview of the topic, taking readers from the general to the specific, first covering broad issues, then the more specific topics of pilot performance, human factors

in aircraft design, and vehicles and systems. The new editors offer essential breath of experience on aviation human factors from multiple perspectives (i.e. scientific research, regulation, funding agencies, technology, and implementation) as well as knowledge about the science. The contributors are experts in their fields. Topics carried over from the first edition are fully updated, several by new authors who are now at the fore of the field. New material - which represents 50% of the

volume - focuses on the challenges facing aviation specialists today. One of the most significant developments in this decade has been NextGen, the Federal Aviation Administration's plan to modernize national airspace and to address the impact of air traffic growth by increasing airspace capacity and efficiency while simultaneously improving safety, environmental impacts and user access. NextGen issues are covered in full. Other new topics include: High Reliability

Organizational Perspective, Situation Awareness & Workload in Aviation, Human Error Analysis, Human-System Risk Management, LOSA, NOSS and Unmanned Aircraft System. Comprehensive text with up-to-date synthesis of primary source material that does not need to be supplemented New edition thoroughly updated with 50% new material and full coverage of NexGen and other modern issues Instructor website with test bank and image collection makes this the only text

Forthcoming Books

Aviation safety and astronautics safety are taught as technical subjects informed, for the most part, by quantitative methods. Here, as in other fields, safety is often framed as an engineering problem requiring

mathematics-informed solutions. This book argues that the socio-technical approach, encompassing theories grounded in sociology and psychology – such as active learning, high-reliability organising, mindfulness, leadership, followership and empowerment – have much to contribute to the safety performance of these vital industries. It sets out to inspire professionals to embed the whole-system approach into design and operation regimen and demonstrates the potential reputational and financial benefits to manufacturers and operators that accrue from adopting a whole-system

approach to design and operation. The book defines the socio-technical approach to risk assessment and management in aviation and astronautics (astronautics is taken to mean "the design and operation of vehicles for use beyond the earth's atmosphere"), then demonstrates the strengths and weaknesses of this approach through case studies of, for example, the Boeing 737MAX-8 accidents and the loss of the SpaceShipTwo orbiter. Grounding the discourse in familiar case studies engages busy aviation and astronautics professionals. The book's arguments are

explained in such a way that they are readily comprehensible to non-experts. Key concepts are described within a glossary. Photographs, charts and diagrams illustrate key points. Written for a practitioner audience, specifically aviation and astronautics professionals, this book provides a valuable and accessible social sciences perspective on safety that will be directly relevant to their roles.
