Applied behavior analysis (ABA) is the application of the past hundred years of research into how learning works. It has universal application; it can be applied to any situation in which learning is involved. Recently, ABA has gained prominence in the teaching of children with autism—it is currently estimated to affect 1 in every 42 boys and 1 in every 189 girls—since,

while there are many different approaches to treating autism, if learning occurs as a result of any of these different approaches, it will occur in keeping with “the laws of learning” on which ABA is based (you may productively think of it as remedial education for the social communications deficits that define autism). In addition, of the myriad of approaches to the treatment of autism spectrum disorders, applied behavior analysis (ABA) has the most research support and some of the best-trained therapists.

Such shockingly high statistics leave parents feeling hopeless and desperate for solutions. **Hope for Autism: 10 Practical Solutions to Everyday Challenges** provides the hope they seek! ### **A Parent's Introduction to Applied Behavior Analysis:**

**ABA** Dove and Orca Jessica Leichtweisz is passionate about helping families affected by Autism. She has been practicing applied behavior analysis (ABA) since 2004. While searching for information to share with families, she found that there was very little information for families about what ABA is and how it can help families. She also discovered there are a lot of parents who do not have access to ABA services and do not know how to help their kids. She created this valuable resource to introduce parents to what takes place in an ABA session and how to start using ABA with their child even if they do not live in an area where they can access services.

Volume 2 of OBM Applied! hones in on the "why" of performance improvement, specifically on the behaviors, why we do what we do at work. This volume brings special attention to evidence based solutions to improve performance, and how to approach implementation for long lasting impact. --back cover.

Applied Behavior Analysis for Children with Autism Spectrum Disorders Createspace Indie Pub Platform

Autism was once thought of as a rare condition, until the Centers for Disease Control and Prevention 's Autism and Developmental Disabilities Monitoring Network released the statistic that about 1 in every 150 eight-year-old children in various areas across the United States is afflicted by an autism spectrum disorder, or ASD. This news led to a dramatic expansion of research into autism spectrum disorders and to the emergence of applied behavior analysis (ABA) as the preferred method of treatment, even among prescribing practitioners. Applied Behavioral Analysis for Children with Autism Spectrum Disorders ably synthesizes research data and

trends with best-practice interventions into a comprehensive, state-of-the-art resource. Within its chapters, leading experts review current ABA literature in depth; identify interventions most relevant to children across the autism spectrum; and discuss potential developments in these core areas: Assessment methods, from functional assessment to single case research designs. Treatment methods, including reinforcement, replacement behaviors, and other effective strategies. The role of the differential diagnosis in ABA treatment planning. Specific deficit areas: communication, social skills, stereotypies/rituals. Target behaviors, such as self-injury, aggression, adaptive and self-help problems. ASD-related training concerns, including maintenance and transition issues, and parent training programs. This volume is a vital resource for researchers, graduate students, and professionals in clinical child and school psychology as well as the related fields of education and mental health.

OBM Applied! Volume 2  
Brookes Publishing Company  
Applied behavior analysis (ABA) has become a widely used form of therapy for autistic children without its theories and methods being well understood. This critical analysis of the theories and research on which ABA bases its claim to being an evidence-based treatment is a must-read for everyone who has a stake in the lives of autistic individuals. This book reviews the literature which shows that ABA is not based on scientific research, and that practitioners

of ABA are not required to be trained in child psychology, pediatrics, child development, education, family therapy, language development, or scientific research. ABA is not based on any form of developmental science, but primarily on the works of B.F. Skinner whose ideas were first published over seventy years ago. This philosophical viewpoint, radical behaviorism, holds that individual experiences are irrelevant to behavior change because the determining factors of our actions are in the environment; the rewards and punishments that result from those actions. This in-depth analysis of the theories and research of ABA leads to the conclusion that ABA is not an applied science, nor does it promote values consistent with current models of child development and education. Other promising methods based on modern science, including parent-directed early infancy pre-emptive strategies and peer-based LEGO Clubs, also discussed here, are often overshadowed by the media coverage and marketing strategies of ABA-based autism services, despite these messages being overstated and misleading. Simply put, the public trust and investment in ABA services needs to be reviewed in greater detail, and with greater skepticism. The pseudoscientific concepts described by behavior analysts sound convincing to

many, but upon closer examination amount to little more than what most educators and parents typically do already, and at the same time, involve costly and invasive services with little or no evidence of meaningful benefit. Some natural strategies such as peer-mentoring and caregiver training do help autistic children and their families to adapt to mainstream settings, the persistent promise of evidence-based autism treatment, has generated an expanding market for ABA services which actually interferes with typical social development. Modern views of child development, social and cultural adaptability, play, and education emphasize integration of individuals and their sociocultural environments. Less costly, proactive, and non-invasive approaches to improving social adaptability and quality of life for autistic children and their caregivers are currently available, but unlike ABA-based services, they are not widely promoted in the public media or offered directly to families by thousands of newly certified providers. A science-based and holistic understanding of the life experiences of autistic individuals recognizes the importance of sociocultural adjustment and long-term quality of life, not behavioral compliance in adult-controlled settings, even when those settings are described as naturalistic. Radical behaviorism was not and

will never be compatible with developmental models which view development as a reciprocal and dynamic synergistic process, not the outcome of a successful behavior plan. It is important for those who care about diversity in society to promote the creative contributions of individuals with diverse life experiences and to stop thinking about being different as a behavior problem.
