Proven strategy for reducing production and operating costs while increasing profits As the growth of the Internet shifts power to consumers, the pressure on companies to keep prices low will continue to mount. Increasingly corporations are relying on "margin management" and supply chain management as a means of keeping prices low while raising profits. Activity-based costing and management (ABC/M) data is key to succeeding in both these critical management strategies. This book explains how executives can effectively use the information furnished by cutting-edge ABC/M systems. The author, an acknowledged expert in the field, clearly defines the ABC/M system and explains how to use the information it provides for best results. He provides a rational framework for understanding the fifteen key defining characteristics of ABC/M and arms readers with an ABC/M Readiness Assessment test along with extremely user-friendly exhibits.

In the classroom, ABC looks like a great way to manage a company's resources. But many executives who have tried to implement ABC on a large scale in their organizations have found the approach limiting and frustrating. Why? The employee surveys that companies used to estimate resources required for business activities proved too time-consuming, expensive, and irritating to employees. This book shows you how to implement time-driven activity-based costing (TDABC), an easier and more powerful way to implement ABC. You can now estimate directly the resource demands imposed by each business transaction, product, or customer. The payoff? You spend less time and money obtaining and maintaining TDABC data—and more time addressing problems that TDABC reveals, such as inefficient processes, unprofitable products and customers, and excess capacity. The authors also show how to use TDABC to link strategic planning to operational budgeting, to enhance the due diligence process for mergers and acquisitions, and to support continuous improvement activities such as lean management and benchmarking. In presenting their model, the authors define the two questions required to build TDABC: 1) How much does it cost per time unit to supply resource capacity for each business process? 2) How much resource capacity (time) is required to perform work for a company's many transactions, products, and customers? The book demonstrates how to develop simple, valid answers to these two questions. Kaplan and Anderson illustrate the TDABC approach with a wealth of case studies, in diverse settings, based on actual implementations.
