Covering infancy through adolescence and emerging adulthood, this important work outlines major areas of research and examines specific topics, ongoing controversies, and current work being done by leaders in the field. The first work on the topic of its scale, the Encyclopedia offers scholarly, authoritative information from an international team of experts that spans ten volumes. The content of the encyclopedia is organized in two main parts—Child and Adolescent—and ten subparts. The first six volumes focus on topics of growth, behavior, cognition, emotion, family, and community in child development. The final four volumes explore

the history, theory, and culture of adolescent development, biology and cognition, social contexts, and of the development of the self in adolescence and emerging adulthood. Designed to be the first and principal resource for students, researchers and practitioners in the field, this unique work: Presents the largest, most up-to-date reference work focused on child and adolescent development presently available Provides comprehensive coverage of major topics rather than a very large number of briefer entries and more trivial topics Covers mental health disorders that are defined by the current DSM-5 Examines concepts related to the historical and social context of child and adolescent development Addresses culture and its effect on child and adolescent development Emphasizes evidence-based practices **The Encyclopedia of Child and Adolescent Development** is an indispensable work for students and practitioners in fields such as psychology, sociology, social work, human development, medicine and biological sciences, education, law, and history, as well as general readers with interest in the field. **Abnormal Psychology F.A. Davis** The **Advances in Clinical Child Psychology** series is directed toward the clinicians and researchers in child psychology to alert them to new

developments, data, and concepts which advance the ability of these professionals to help troubled children. This volume represents our attempt to highlight the emerging issues and breakthroughs that are likely to guide our field of inquiry in the near future. Our goal in selecting authors to contribute to this series is to seek out those whose work is innovative, relevant, and likely to influence future work in clinical child psychology and related fields. Each author is chosen either on the basis of potentially important new information or viewpoints in his or her own work, or because the author is especially well-qualified to discuss a topic that is not restricted to one program of research. In this volume, the impact of disciplines other than psychology on clinical child psychology is well-documented. Rubenstein presents a wide-ranging overview of research on the neurological causes, indicators, and reflections of developmental disorders, including a section on the physiological basis of autism. Costello explores how epidemiology is being applied to child psychiatry and offers

insights into the growing importance of applying epidemiological methods to clinical practice.
