Of the five senses, smell is the most direct and food aromas are the key drivers of our flavor experience. They are crucial for the synergy of food and drinks. Up to 80% of what we call taste is actually aroma. Food Aroma Evolution: During Food Processing, Cooking, and Aging focuses on the description of the aroma evolution in several food matrices. Not only cooking, but also processing (such as fermentation) and aging are responsible for food aroma evolution. A comprehensive evaluation of foods requires that analytical techniques

keep pace with the available technology. As a result, a major objective in the chemistry of food aroma is concerned with the application and continual development of analytical methods. This particularly important aspect is discussed in depth in a dedicated section of the book. Features Covers aromatic evolution of food as it is affected by treatment Focuses on food processing, cooking, and aging Describes both classic and new analytical techniques Explains how the flavor perception results are influenced by other food constituents The book comprises a good mix of referenced research with practical applications, also reporting case studies of these various applications of novel technologies. This text represents a comprehensive

reference book for students, educators, researchers, food processors, and food industry personnel providing an up-to-date insight. The range of techniques and materials covered provides engineers and scientists working in the food industry with a valuable resource for their work.
