Methodology. As mentioned previously,
building a predictive model involves first
training the model (and building the
tree) by using known data and verifying
its accuracy and reliability by using the
model on test data that had been set
aside to predict the known test
outcomes.

Predictive modeling uses mathematical
and computational methods to predict an

event or outcome. These models forecast an outcome at some future state or time based upon changes to the model inputs. Using an iterative process, you develop the model using a training data set and then test and validate it to determine its accuracy for making predictions.

To construct a model that has high predictive and descriptive accuracy, ref. 40 introduces a method for learning lists of if-then rules that are predictive of 1-y stroke risk. The resulting classifier, displayed in SI Appendix , Fig. S1 , requires only 7 if-then statements to achieve competitive accuracy and is easy for even nontechnical practitioners to quickly understand.

Key states. We use two metrics to measure states' importance. One is the "tipping-point probability": the chance that a state will cast the decisive 270 th electoral vote for the victor. The other is the chance that any single voter in a state will cast the decisive ballot that wins the tipping-point state for the next president.
