Speech and language technologies continue to grow in importance as they are used to create natural and efficient interfaces between people and machines, and to automatically transcribe, extract, analyze, and route information from high-volume streams of spoken and written information. The workshops on Mathematical Foundations of Speech Processing and Natural Language Modeling were held in the Fall of 2000 at the University of Minnesota's NSF-sponsored Institute for Mathematics and Its Applications, as part of a "Mathematics in Multimedia" year-long program. Each workshop brought together researchers in the respective technologies on the one hand, and mathematicians and statisticians on the other hand, for an intensive week of cross-fertilization. There is a long history of benefit from introducing mathematical techniques and ideas to speech and language technologies. Examples include the source-channel paradigm, hidden Markov models, decision trees, exponential models and formal languages theory. It is likely that new mathematical techniques, or novel applications of existing techniques, will once again prove pivotal for moving the field forward. This volume consists of original contributions presented by participants during the two workshops. Topics include language modeling, prosody, acoustic-phonetic modeling, and statistical methodology.

The International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 (BWM Convention), is concerned with preventing, minimizing and ultimately eliminating the risks to the

environment, human health, property and resources arising from the transfer of harmful aquatic organisms and pathogens, through the control and management of ships' ballast water and sediments. The BWM Convention also aims to avoid unwanted side-effects from that control and encourages developments in related knowledge and technology. The 2018 consolidated edition aims to provide an easy and comprehensive reference to the up-to-date provisions and unified interpretation of articles and annex of the BWM Convention

Stochastic Approximation and Recursive Algorithms and Applications Springer Science & Business Media

Probabilistic Reasoning in Intelligent Systems is a complete and accessible account of the theoretical foundations and computational methods that underlie plausible reasoning under uncertainty. The author provides a coherent explication of probability as a language for reasoning with partial belief and offers a unifying perspective on other AI approaches to uncertainty, such as the Dempster-Shafer formalism, truth maintenance systems, and nonmonotonic logic. The author distinguishes syntactic and semantic approaches to uncertainty--and offers techniques, based on belief networks, that provide a mechanism for making semantics-based systems operational. Specifically, network-propagation techniques serve as a mechanism for combining the theoretical coherence of probability theory with modern demands of reasoning-systems technology: modular declarative inputs, conceptually meaningful inferences, and parallel distributed computation. Application areas include diagnosis, forecasting, image interpretation, multi-sensor fusion, decision support systems, plan recognition, planning, speech recognition--in short, almost every task requiring that conclusions be drawn from

uncertain clues and incomplete information.

Probabilistic Reasoning in Intelligent Systems will be of special interest to scholars and researchers in AI, decision theory, statistics, logic, philosophy, cognitive psychology, and the management sciences. Professionals in the areas of knowledge-based systems, operations research, engineering, and statistics will find theoretical and computational tools of immediate practical use. The book can also be used as an excellent text for graduate-level courses in AI, operations research, or applied probability.

A Guide to Ship Repair Estimates in Man-hours Springer Science & Business Media

In the past decade, a number of different research communities within the computational sciences have studied learning in networks, starting from a number of different points of view. There has been substantial progress in these different communities and surprising convergence has developed between the formalisms. The awareness of this convergence and the growing interest of researchers in understanding the essential unity of the subject underlies the current volume. Two research communities which have used graphical or network formalisms to particular advantage are the belief network community and the neural network community. Belief networks arose within computer science and statistics and were developed with an emphasis on prior knowledge and exact probabilistic calculations. Neural networks arose within electrical engineering, physics and neuroscience and have emphasised pattern recognition and systems modelling problems. This volume draws together researchers from these two communities and presents both kinds of networks as instances of a general unified graphical formalism. The book focuses on probabilistic methods for learning and inference in graphical models,

algorithm analysis and design, theory and applications.

Exact methods, sampling methods and variational methods are discussed in detail. Audience: A wide cross-section of computationally oriented researchers, including computer scientists, statisticians, electrical engineers, physicists and neuroscientists.

Expert ship surveyor Don Butler shares a lifetime 's ship repair costing experience in this unique resource for accurate cost estimation and planning Includes hard to come by information on typical ship repair labor expectations for accurate man-hour forecasting and cost estimation Produced for marine engineers and marine industry professionals to aid with repair specification and negotiation, helping you to plan work and budgets more reliably Uses man-hours as opposed to particular rates or currencies, providing a long-term model for pricing regardless of location, rate fluctuation or inflation Bringing together otherwise scattered details on specific repair and dry-docking activities, this invaluable guide will save you time and improve the accuracy of your ship repair estimates. Don ' t plan or commission work without it! Don Butler is a fellow of the Institute of Marine Engineers and a member of Society of Consulting Marine Engineers and Ship Surveyors, UK. Made up of very hard to come by information on typical ship repair labor expectations for accurate man-hour forecasting and cost estimation Produced for marine engineers and marine industry professionals to save time, aid in repair negotiation and help companies to plan more reliably Man-hour listings assist in long-term pricing, meaning the book content remains valid regardless of currency, rate fluctuation or inflation

Monte Carlo Statistical Methods

This book presents a thorough development of the modern theory of stochastic approximation or recursive stochastic algorithms for both constrained and unconstrained problems. This second edition is a thorough revision, although the main features and structure remain unchanged. It contains many additional applications and results as well as more detailed discussion.

Learning in Graphical Models

We have sold 4300 copies worldwide of the first edition (1999). This new edition contains five completely new chapters covering new developments.
