Despite recent improvements in energy efficiency being made in new build, it is important that the existing commercial building sector also take action to meet emission reduction targets. The objectives and challenges of such action will reduce the risk of the sector becoming obsolete due to high energy use and poor environmental performance. This book presents a theory-based, practice-support methodology to deal with sustainable retrofitting opportunities for existing commercial buildings in warm climates using bioclimatic design as the basis. The book has four main parts, focusing on eco-design and renovation, bioclimatic retrofitting, technological and behavioural change and case studies of retrofitting exemplars. In the first part, the context of climate change effects on design and renovation at the city scale is discussed. The second part

looks at bioclimatic retrofitting as a 'design guide' for existing buildings, highlighting the significance of architectural design and engineering systems for energy performance. The technological and behavioural contexts of the existing building sector – policies, modelling, monitoring and trend analysis in respect to energy and environmental performance – are covered in part three. The final part gives some case studies showing the effectiveness of strategies suggested for effective environmental performance. This book is a must-have guide for all involved in the design and engineering of retrofitting projects in warm climates.

This thesis deals with two important and very timely aspects of the future power system operation - assessment of demand flexibility and advanced demand side management (DSM) facilitating flexible

and secure operation of the power network. It provides a clear and comprehensive literature review in these two areas and states precisely the original contributions of the research. The book first demonstrates the benefits of data mining for a reliable assessment of demand flexibility and its composition even with very limited observability of the end-users. It then illustrates the importance of accurate load modelling for efficient application of DSM and considers different criteria in designing DSM programme to achieve several objectives of the network performance simultaneously. Finally, it demonstrates the importance of considering realistic assumptions when planning and estimating the success of DSM programs. The findings presented here have both scientific and practical

significance; they gained her BSc and MSc degrees in electrical engineering from the University of Belgrade in 2011 and 2012 respectively. She graduated with her PhD from the University of Manchester. She has presented at several conferences, and has won runner-up prizes in poster presentation at three. She has authored or co-authored more than 40 journal, conference and technical papers. provide a basis for further research, and can be used to guide future applications in industry.

Visual communication shapes our perceptions and experiences of the world. This is not only a question of photographs or video,

but also the design of websites, the use of data visualization software, the branding of packaging, and even the design of buildings and furniture. Doing Visual Analysis: From Theory to Practice provides a concrete set of tools to research and analyse this wide range of visual data. Showing students how to apply the right mix of methods to their own research projects, it equips them with the skills to break down and analyse the range of contemporary visual communication. The book: Provides examples of how and where certain tools can be used in a project or dissertation. Discusses the type of research questions best suited to different tools and methods. Shows students how to mix approaches and use tools alongside other methods, such as content analysis or interviews. Doing Visual Analysis is an essential companion for students and

This volume explores the relationship between space, pedagogy, and technology, with a particular focus on the latter since it is the connecting element that relates to all analysed contexts. The learning experience is investigated and supported by a review of works by referenced authors, underlining the active learning approach that can create better alliances among users and redefine the role

of the teacher as a director and a facilitator. The volume offers a conceptualisation of learning technologies for innovative learning environments by creating a grid of technologies for active approaches. Then, it reflects on the comparison between the on-site and online learning environments, focusing on a stressful context. It offers and discusses an instructional design tool that supports teachers in designing hybrid learning contexts. Practitioners who wish to reframe technology in teaching using both digital and physical resources will find it very inspiring.

Bioavailability refers to the extent to which humans and ecological receptors are exposed to contaminants in soil or sediment.

The concept of bioavailability has recently piqued the interest of the hazardous waste industry as an important

consideration in deciding how much waste to clean up.

The rationale is that if contaminants in soil and sediment are not bioavailable, then more contaminant mass can be left in place without creating additional risk. A new NRC report notes that the potential for the consideration

of bioavailability to influence decision-making is greatest where certain chemical, environmental, and regulatory factors align. The current use of bioavailability in risk assessment and hazardous waste cleanup regulations is demystified, and acceptable tools and models for bioavailability assessment are discussed and ranked according to seven criteria. Finally, the intimate link between bioavailability and bioremediation is explored. The report concludes with suggestions for moving bioavailability forward in the regulatory arena for both soil and sediment cleanup.
