Active Chemistry. 96 • An element is any pure substance in the periodic table that cannot be chemically broken down into simpler materials. Each

element has its unique atomic number, chemical properties, and symbol. • All matter is composed of atoms which are the smallest particles that retain the chemical properties of the element.

Active Site Chemistry. Active sites are the parts of enzymes that are substrate-specific. Certain enzymes will only bind to certain substrates because of a site resembling a lock-key on the surface of the enzyme. We will be taking a look at a very common enzyme family called serine protease as an example of how active site chemistry works.
