CI/ASCE Standard 38-02 presents a credible system for classifying the quality of utility location information that is placed in design plans. The Standard addresses issues such as: how utility information can be obtained, what technologies are available to obtain that information; how that information can be conveyed to the information users; who should be responsible for typical collection and depiction tasks; what factors determine which utility quality level attribute to

assign to data; and what the relative costs and benefits of the various quality levels are. Used as a reference or as part of a specification, the Standard will assist engineers, project and utility owners, and constructors in developing strategies to reduce risk by improving the reliability of information on existing subsurface utilities in a defined manner.

Since 1958 the Maritime Administration has continuously

conducted instructions in use of collision avoidance radar for qualified U.S. seafaring personnel and representatives of interested Federal and State Agencies. Beginning in 1963, to facilitate the expansion of training capabilities and at the same time to provide the most modern techniques in training methods, radar simulators were installed in Maritime

Administration's three region schools. It soon became apparent that to properly instruct the trainees, even with the advanced equipment, a standardize up-to-date instruction manual was needed. The first manual was later revised to serve both as a classroom textbook and as an onboard reference handbook. This newly updated manual, the

fourth revision, in keeping with Maritime Administration policy, has been restructured to include improved and more effective methods of plotting techniques for use in Ocean, Great Lakes, Coastwise and Inland Waters navigation. Robert J. Blackwell Assistant Secretary for Maritime Affairs

Tiny House Living
Imagine living a simple life free of mortgage and rent in a little house that contains all that you need to live a comfortable life. The ever changing economic environment in the world is forcing many people to reevaluate how they live. Because of the recent economic troubles in the world especially the recent recession in the U.S. that resulted in many people falling behind

in mortgage payment or losing their homes, many people are now considering adopting life in small houses that they can build on their tracks or in a small space. Because of this, the United States is being swept by the tiny house movement. Tiny house living is about living a simple and beautiful life in a tiny home with everything you need and with freedom from economic pressures associated with rent and mortgage payment of a conventional home.

What is maybe considerably more essential than the economic benefits of owning a tiny home is the environmental advantages. Living in a Tiny House conveys a much smaller ecological impact, decreases the number of appliances you need to live and encourages you to consume less. These lifestyle adjustments greatly help conserve the environment. pick up your copy today by clicking the BUY NOW button at the top of this page!

After an initial field study of the performance and durability of brick veneer/steel stud wall systems (BV/SS), CMHC commissioned a series of building science experiments

and theoretical studies to see how deficiencies observed in the field could be avoided in future BV/SS designs. This guide summarizes the findings of several of these projects and shows how to apply the results. Subjects dealt with in the guide include: rain penetration control; condensation control; thermal bridging; construction sequencing; quality control; testing and

commissioning; and maintenance and repair. Construction details (in DWG and DXF format) and the master specifications for lateral loadbearing steel studs (in WordPerfect 5 and ASCII 1 text) are provided on diskette and can be copied and modified for project use. Measurements are provided in both metric and imperial versions.
