The Apple Watch Series 5 combines all the features you could ever want from a wearable band. Every year, Apple has been adding necessary features to make the Apple watch better. The Series 2 came with the needed power for native apps. After that, Series 3 brought cellular connectivity and Series 4 had display pushed to full capacity.

Series 5 allows for an always-on display. The watch is now a watch. If you own the Series 4, an always-on display may not be reason enough to upgrade. However, the Series 5 offers much more. Apple is not the first manufacturer to do this, but they might as well be the best. Monochrome veneer, secondary display layer—all these things are not there. You only get an existing watch face; always on. How does it work? With previous versions, the Apple Watch would go into sleep mode when you were not interacting with it. The same thing happens with the Apple Series 5.

The new device, HomePod, offers an easy and amazing way for Apple users to enjoy AirPlay, Apple Music, and control their HomeKit devices from anywhere.

HomePod was not created to be a competitor to Google Home or Amazon Echo, just as the MacBook Air was not designed to compete against the netbook. Of course, they do share a number of characteristics. For instance, the HomePod smart speaker can be voice-controlled and the MacBook Air is compact and lightweight. However, HomePod is just a \$350 home assistant; much like the MacBook was a \$200 laptop computer. The Fire Phone by Amazon was not much of a hit. Alexa, therefore, had to sell a lot so that Prime could stick into more people's lives. This was a success, thanks to the priced-to-move Echo. Google, on the other hand, made a brilliant decision to follow in the footsteps because it has to satisfy its insatiable data thirst. When it comes to HomePod, something was a little different. The AirPods were designed to help you enjoy your favorite music on the go while HomePod was designed to help you enjoy your favorite music in a convenient way in your home. AirPods lacked wires and sufficient surface area for traditional buttons. Because of this, the Siri voice control was the only way to interact with the gadget (you have to be near the device). HyperCard Partly Inspired the Web The HyperCard was created by Bill Atkinson in 1987. Through this app, anyone could create on-screen cards with hyperlinks, images, or texts. The Mac laptop is advanced right out of the box, it comes with many basic tools such as calendar management, email, etc. However, there is another world of powerful software for Apple Mac that will make complicated tasks easier. Although most of them are not free, they only cost a few bucks and they are well worth it. Here are some of the best.

Google Assistant is a digital helper that understands audio commands or questions. Other companies have their digital

What Is Social Media

Engagement? It is the number of shares, likes, and comments. A big following is great, but an engaged audience is better than a big one—quality over quantity.

There are certain metrics used to measure social media engagement. They include: Use of branded hashtags. Mentions. Click-throughs. Audience and followers' growth. Likes. Comments. Retweets/shares. Your followers can naturally start engaging with your content.

But often, you may need to encourage them a little. Here are a few tricks to help you with that. Assess your engagement: see how many followers you have, the average number of shares and comments you get on each post and any other relevant numbers. Make sure you continue monitoring these numbers. Choose your strategy: every company has different goals and strategies are, thus, different. Your strategy will depend on your goals. This could be educating the audience, collecting feedback, changing the public perception, etc. Understand your audience: it is not easy to engage people you do not know.

Linux is the only endpoint OS that is growing globally. As one person put it, "Linux is the Nikola Tesla of information technology". This OS is used in a myriad of devices including smartphones, digital video recorders, televisions, airline entertainment systems, digital signage, automobile control systems, switches, routers, the desktop, among many others. The Microsoft Windows vs Linux OS debate will not end anytime soon. However, it is very clear that Linux is winning. If

you have a hard time believing this, consider the influence of Linux on Android and UNIX-based Apple devices. The only reason Windows is still common is because of its influence on many core applications. This is about to change, and Linux is, without a doubt, the future. Microsoft has been the king of End User Computing (EUC) for about 30 years.

Nonetheless, there are factors such as security concerns that are pushing EUC to the data center.

Due to this, there is a desire to reduce the costs and risks that are required to maintain Windows on the edge. Linux OS offers the perfect solution for this. Linux is layered and lightweight which enables it to perform very well

---

across many types of devices. It also offers high speed and responsiveness. Because Linux has so many inherent advantages, it is preferred for endpoint applications.

According to some, the idea of Ethereum was born in 2009, when Bitcoin became the first practical solution of decentralization.

Undoubtedly, the success of Blockchain greatly influenced Vitalik Buterin, the man behind Ethereum. However, 2012 would be a more particular date. That is when Vitalik left the University of Waterloo to travel the world while participating in various cryptocurrency

innovations. While on this trip, Buterin conceived the Ethereum idea; a crypto economically secured platform for creating any kind of decentralized application. After that, Vitalik started drafting the Ethereum Whitepaper. The document justified the idea of a new crypto technology, stated its main principles, and possible applications. The whitepaper was published in 2013, and a month later, Buterin announced the beginning of Ethereum project during the Bitcointalk forum. In his post, Vitalik said that he was working with Jeffrey Wilcke and Dr. Gavin Wood as principle core developers. Wood took the main part in Ethereum creation after Vitalik. His Yellow Paper (the formal

---

specification of Ethereum Virtual Machine) was published in April 2014. Coding its very first practical implementation in seven programming languages, this was the development of the first prototype of Ethereum platform. Just like Ethereum, Bitcoin is based on Blockchain technology, but this means nothing if it is not backed by the most powerful network in history. Investors channeled millions of dollars into Bitcoin, using the money on trading, mining equipment, and technologies. Launching a network like that demands the same amount (or more) of effort. To kick-start a group of investors, miners, and developers, the Ethereum foundation

chose to carry out a pre-sale of more than 60M digital tokens (Ethers). The campaign ended up being a major success.

In college he played point guard for Clemson before turning pro. Later, with a keen eye for talent and vested interest in the basketball community, he pivoted to marketing, where he was eager to build relationships with young athletes who might one day become ambassadors for Nike and Adidas. But as his network expanded and his responsibilities as a shoe rep grew, he found himself thrust into the dark underbelly of profit-driven college basketball programs, and the storied coaches who led them. He realized that the NCAA's amateurism rules, which

---

prohibit athletes from receiving compensation until they go pro, were exploiting young athletes, and athletes of color in particular. Colleges and universities, he observed, were using corporate sponsors to circumvent the NCAA's bylaws, and employees like Code were stuck in the middle. Now, for the first time, Code will share his side of the explosive story of college basketball's dark reality. Code has engaged with the sport at every level—from the AAU circuit, to college recruiting battles, to wooing NBA stars to sign sneaker deals. He's been responsible for recruiting athletes like Zion Williamson, Anthony Davis, and Giannis Antetokounmpo to endorse the shoes of his employers. But Code has also seen the darker side of college basketball. He recounts how he became the fall guy for a bribery scandal involving payments to college and high school athletes, while the storied coaches implicated by the FBI were not charged and still walk the sidelines. Highlighting stories of real athletes and their families and what's at stake for them, Code pulls back the curtain on the systemic problem of using players for financial gain in college athletics. Propulsive, urgent, and eye-opening, *Black Market* exposes the truth to offer a more just way forward for both colleges and athletes.

Society relies heavily on credit for most financial decisions. Today, good credit is not just important for getting a loan or a credit card. Many businesses have to check

---

your credit before deciding whether or not they will extend their products and services to you. Mortgage lenders need to be sure that you will pay your mortgage responsibly before they can finance you. Without good credit, the mortgage lender concludes that giving you a loan is risky for them. If they still approve, regardless of your poor credit, they will charge you a very high interest rate. Bad credit will see you pay a higher mortgage amount or worse, your mortgage application will be declined. Just because you are not currently interested in buying a house does not mean that your credit does not matter. Landlords will, in most cases, consult your

credit before renting you a house or apartment. Your lease is considered a loan. You require a loan to purchase a car unless you have the full amount at hand. Your credit score affects the loan amount and interest rate and whether or not you will be given the loan in the first place. With excellent credit, you will qualify for a higher loan amount and the interest rate will be lower. A poor credit score translates to limited options. Not many lenders will be ready to finance you and the few that will be willing might charge a very high interest rate.

released. iOS 12 and iPad Gesture navigation and the status bar layout have been imported from iPhone X. Performance has been improved and even older iPads can now launch faster and work more smoothly. Memos and Apple's Stocks have also been introduced. iOS 12 aims at making iPad and iPhone more responsive and faster on the current generation of iOS devices as well as older ones. iOS 12 also comes with a new solution for memory. People are expecting Apple to release phones in 2019 so their customers can continue to have a wide range of options. In 2018, they released the iPhone XS (5.8 inches), the iPhone XR (6.1 inches) and the iPhone XS Max

---

(6.5 inches). You can get the XR for \$749+ and the XS iPhones for \$999+.

This trend is expected to continue in 2019.

According to rumors, you may see 6.5 and 5.8-inch OLED phones and probably a 6.1-inch LCD one. It is hard to guess what the new iPhones will be named but iPhone 11 or iPhone XI are huge possibilities. People started speculating about the 2019 iPhones even before Apple announced the XR and the XS. A few details about the new phones are out.
