Recent innovations and new technologies in education have altered the way teachers approach instruction and learning and can provide countless advantages. The pedagogical value of specific technology tools and the cumulative effects of technology exposure on student learning over time are two areas that need to be explored to better determine the improvements needed in the modern classroom. Advanced Methodologies and Technologies in Modern Education Delivery provides emerging research on educational models in the continually improving classroom. While highlighting the challenges facing modern in-service and pre-service teachers when educating students, readers will learn information on new methods in curriculum development, instructional design, and learning assessments to implement within their classrooms. This book is a vital resource for pre-service and in-service teachers, teacher education professionals, higher education administrative professionals, and researchers interested in new curriculum development.

Selected Water Resources Abstracts Springer Science & Business Media

There are 2.4 billion people without improved sanitation and another 2.1 billion with inadequate sanitation (i.e. wastewater drains directly into surface waters), and despite improvements over the past decades, the unsafe management of fecal waste and wastewater continues to present a major risk to public health and the environment (UN, 2016). There is growing interest in low cost sanitation solutions which harness natural systems. However, it can be difficult for wastewater utility managers to understand under what conditions such nature-based solutions (NBS) might be applicable and how best to combine traditional infrastructure, for example an activated sludge treatment plant, with an NBS such as treatment wetlands. There is increasing scientific evidence that treatment systems with designs inspired by nature are highly efficient treatment technologies.

The cost-effective design and implementation of ecosystems in wastewater treatment is something that exists and has the potential to be further promoted globally as both a sustainable and practical solution. This book serves as a compilation of technical references, case examples and guidance for applying nature-based solutions for treatment of domestic wastewater, and enables a wide variety of stakeholders to understand the design parameters, removal efficiencies, costs, co-benefits for both people and nature and trade-offs for consideration in their local context. Examples through case studies are from across the globe and provide practical insights into the variety of potentially applicable solutions.

Systems Analysis and Design for Advanced Modeling Methods: Best Practices Information Today

The problem of developing a systematic approach to the design of feed back strategies capable of shaping the response of complicated dynamical control systems illustrates the integration of a wide variety of mathematical disciplines typical of the modern theory of systems and control. As a concrete example, one may consider the control of fluid flow across an airfoil, for which recent experiments indicate the possibility of delaying the onset of turbulence by controlling viscosity through thermal actuators located on the airfoil. In general, there are two approaches to the control of such a complicated process, the development of extremely detailed models of the process followed by the derivation of a more "dedicated" feed back law or the development of a more simple model class followed by the derivation of control laws which are more robust to unmodelled dynamics and exogenous disturbances. In either approach, the two twin themes of approximation and computation play a significant role in the derivation and implementation of resulting control laws. And there is no doubt that the cross-fertilization between these twin themes and control theory will increase unabated throughout the next decade, not just as an important component of design and implementation of control laws but also as a source of new problems in computational mathematics. In this volume, we present a collection of papers which were delivered at the first Bozeman Conference on Computation and Control, held at Montana State University on August 1-11, 1988.

To meet the demands of archivists increasingly tasked with the responsibility for hybrid collections, this indispensable guide covers contemporary archival practice for managing analog and digital materials in a single publication. Terms describing activities central to the archival process—such as appraisal, acquisition, arrangement, description, storage, access, and preservation—are included. In addition, responsibilities traditionally considered outside the purview of the archivist but currently impacting professional activities—such as cybersecurity, digital forensics, digital curation, distributed systems (e.g., cloud computing), and distributed trust systems (e.g., blockchain)—are also covered. The Handbook is divided into ten sections: current environment; records creation and recordkeeping systems; appraisal and acquisition; arrangement and description; storage and preservation; digital preservation; user services; community outreach and advocacy; risk management, security and privacy; and management and leadership. Some terms touch on more than one category, which made sorting a challenge. Readers are encouraged to consult both the table of contents and the index, as a topic may be addressed in more than one entry. A total of 111 entries by 105 authors are defined and described in The Handbook. The majority (79) of the contributors were from the US, 12 from Canada, 7 from the United Kingdom, 3 from Australia, 1 each from Germany, Jamaica, New Zealand, and the Russian Federation. Because archival practice differs among practitioners in different countries, this work represents an amalgamation. The Handbook was written primarily for archival practitioners who wish to access desired information at the point of need. However, can also serve as a valuable resource for students pursuing careers in the archival profession and information professionals engaged in related fields.

For research in all subjects and among different philosophical paradigms, research methodologies form one of the key issues to rely on. This volume brings a series of papers together, which present different research methodologies as applied in supply chain management. This comprises review oriented papers that look at what kind of methodologies have been applied, as well as methodological papers discussing new developments needed to successfully conduct research in supply chain management. The third group is made up of applications of the respective methodologies, which serve as examples on how the different methodological approaches can be applied. All papers have undergone a review process to ensure their quality. Therefore, we hope that this book will serve as a valid source for current and future researchers in the field. While the workshop on "Research Methodologies in Supply Chain

Management ” took place at the Supply Chain Management Center, Carl von Ossietzky Univ- sity in Oldenburg, Germany, it is based on a collaboration with the Supply Chain Management Group of the Department of Operations Management at the Cop- hagen Business School and the Department of Production Management at the Vienna University of Economics and Business Administration. We would like to thank all those who contributed to the workshop and this book.
