This book presents cutting-edge research on innovative system interfaces, highlighting both lifecycle development and human – technology interaction, especially in virtual, augmented and mixed reality systems. It describes advanced methodologies and tools for evaluating and improving interface usability, and discusses new models, case studies and good practices. The book addresses the human, hardware, and software factors in the process of developing interfaces for optimizing total system performance, while minimizing costs. It also highlights the forces currently shaping the nature of computing and systems, such as the importance of portability and technologies for reducing power requirements; the need for better assimilation of computation in the environment; and solutions to promote computer and system accessibility for people with special needs. Based on the AHFE 2020 Virtual Conference on Human Factors and Systems Interaction, held on July 16 – 20, 2020, the book offers a timely survey and a practice-oriented guide for systems interface users and developers alike.

The use of sign language has a long history. Indeed, humans' first languages may have been expressed through sign. Sign languages have been found around the world, even in communities without access to formal education. In addition to serving as a primary means of communication for Deaf

communities, sign languages have become one of hearing students' most popular choices for second-language study. Sign languages are now accepted as complete languages that are the linguistic equals of spoken languages. Sign-language research is a relatively young field, having begun fewer than 50 years ago. Since then, interest in the field has blossomed and research has become much more rigorous as demand for empirically verifiable results have increased. In the same way that cross-linguistic research has led to a better understanding of how language affects development, cross-modal research has led to a better understanding of how language is acquired. It has also provided valuable evidence on the cognitive and social development of both deaf and hearing children, excellent theoretical insights into how the human brain acquires and structures sign and spoken languages, and important information on how to promote the development of deaf children. This volume brings together the leading scholars on the acquisition and development of sign languages to present the latest theory and research on these topics. They address theoretical as well as applied questions and provide cogent summaries of what is known about early gestural development, interactive processes adapted to visual communication, linguistic structures, modality effects, and semantic, syntactic, and pragmatic development in sign. Along with its companion volume, *Advances in the Spoken Language Development of Deaf and Hard-of-Hearing Children*, this book will provide a deep and broad picture about what is known about deaf children's language development in a variety of situations and contexts. From this base of information, progress in research and its application will accelerate, and barriers to deaf children's full participation in the world around them will continue to be overcome.

Advances in Biological Science Research: A Practical Approach provides discussions on diverse research topics and methods in the biological sciences in a single platform. This book provides the latest technologies, advanced methods, and untapped research areas involved in diverse fields of biological science research such as bioinformatics, proteomics, microbiology, medicinal chemistry, and marine science. Each chapter is written by renowned researchers in their respective fields of biosciences and includes future advancements in life science research. Discusses various research topics and methods in the biological sciences in a single platform. Comprises the latest updates in advanced research techniques, protocols, and methods in biological sciences. Incorporates the fundamentals, advanced instruments, and applications of life science experiments. Offers troubleshooting for many common problems faced while performing research experiments.

This volume contains selected contributions to the interdisciplinary symposium on 'Models of Meaning' held in Varna, September 25-28, 1988, under the auspices of the Institute of the Bulgarian Language of the Bulgarian Academy of Sciences. The aim of the meeting was to broaden the horizons of meaning research and the modeling of linguistic semantics, with contributions centering on the appropriate modeling of lexical, syntactic, and textual-semantic representations. The papers challenge some basic notions of semantics and

reveal two main avenues of development in contemporary investigations. One is toward broadening the scope of investigativeness, the second is toward a greater domain-specificity as expressed in a greater sensitivity to pragmatics and meta-pragmatic concerns.

All work is work in progress. The ideas developed in this work could be (and probably will be) developed further, revised, and expanded. But it was time to write them down and send them out. Some of these ideas about linking had their origins in my 1987 dissertation. However, this work has grown beyond the dissertation in a number of important ways. The most important of these advances lie in, first, articulating aspectual roles as linguistic objects over which lexical semantic phenomena can be stated, and over which linking generalizations are stated; second, recognizing that syntactic phenomena may be classified as to whether or not they are sensitive to the core event of event structure; and third, recognizing the modularity of aspectual and thematic/conceptual structure, and associating that modularity with a difference between language-specific and universal language generalizations. The three chapters of the book are organized around these ideas. I have tried to state these ideas as strong theses. Where they make strong predictions I have meant them to do so, as a probe for future research. I hope that other researchers will take up the challenge to investigate, test and develop these ideas across a wider realm of languages than I --as one person --can do.

This book provides an up-to-date survey of current issues and approaches in corpus linguistics in the form of twenty-two recent research articles. The articles cover a wide range of topics illustrating the diversity of research that is characteristic of corpus linguistics today. Central themes are the relationship between theory, intuition and corpus data and the role of corpora in linguistic research. The majority of the articles are empirical studies of specific aspects of English, ranging from lexis and grammar to discourse and pragmatics. Other areas explored are language variation, language change and development, language learning, cross-linguistic comparisons of English and other languages, and the development of linguistic software tools. The contributors to the volume include some of the leading figures in the field such as M.A.K. Halliday, John Sinclair, Geoffrey Leech and Michael Hoey. The theoretical and methodological issues addressed in the volume demonstrate clearly the steady advance of an expanding discipline inspired by an empirical, usage-based approach to the study of language. The volume is essential reading for researchers and students interested in the use of computer corpora in linguistic research.

This book reports on the latest advances in understanding cross-cultural decision and human cognition with respect to various cultural constructs, such as geographical, historical, sociological, and organizational cultures. It addresses researchers, scholars, and industry practitioners from diverse fields, including sociology, linguistics, business, military science, psychology, human factors research, neuroscience, and education. The book covers a wealth of topics, including: analyses of historical events and intercultural competence; commercial applications of social-cultural science; the study of decision-making similarities (and differences) across cultures; cultural behavioral modeling and simulation technology; and social networks and studies on group communication alike. It also reports on real-world case studies relevant to cross-cultural decision-making. The book's main goal is to combine studies from other relevant disciplines such as causal analysis in complex environments, team decision making and social changes to develop a more holistic understanding of the decisions that people, groups, and societies make, so as to improve our ability to forecast and plan for the future. Based on the AHFE 2017 International Conference on Cross-Cultural Decision Making (CCDM), held on July 17–21, 2017, in Los Angeles, California, USA, this book offers a multidisciplinary view on the impact of culture on people's cognition and behavior, and a timely reference guide to new applications and future challenges.

Advances in Dairy Microbial Products presents a thorough reference that explains the makeup of these products in a scientifically sound, yet simple manner. It offers both established and cutting-edge solutions on the numerous challenges commonly encountered in the industrial processing of milk and the production of milk products. It is an ideal resource for researchers and practitioners involved in dairy science, particularly those who wish to gain the most thorough and up-to-date information on dairy microbial products. In addition, it will appeal to beginners seeking to understand how advanced dairy technologies can be used to increase the efficiency of current techniques. Examines the advances of dairy products in healthcare, environment and industry Elaborates upon advanced perspectives, wide applications, traditional uses and modern practices of harnessing potential of microbial products Includes helpful illustrations of recent trends in dairy product research

The rise of experimental philosophy is generating pressing methodological questions for philosophers. Can findings from experimental studies hold any significance for philosophy as a discipline? Can philosophical theorizing be improved through consideration of such studies? Do these studies threaten traditional philosophical methodology? *Advances in Experimental Philosophy and Philosophical Methodology* addresses these questions, presenting a variety of views on the potential roles experimental philosophy might play in philosophical debate.

Featuring contributors from experimental philosophy, as well as those who have expressed criticism of the experimental philosophy movement, this volume reflects on the nature of philosophy itself: its goals, its methods, and its possible future evolution. Tackling two major themes, contributors discuss the recent controversy over the degree to which intuition plays a major role in philosophical methodology and the characterization of the role of the experimental philosophy project. They also look at the relationship between so-called 'positive' and 'negative' projects and examine possible links between experimental and mainstream philosophical problems. Close discussion of these themes contributes to the overall goal of the volume: an investigation into the current significance and possible future applications of experimental work in philosophy.

As future generation information technology (FGIT) becomes specialized and fr- mented, it is easy to lose sight that many topics in FGIT have common threads and, because of this, advances in one discipline may be transmitted to others. Presentation of recent results obtained in different disciplines encourages this interchange for the advancement of FGIT as a whole. Of particular interest are hybrid solutions that c- bine ideas taken from multiple disciplines in order to achieve something more signi- cant than the sum of the individual parts. Through such hybrid philosophy, a new principle can be discovered, which has the propensity to propagate throughout mul- faceted disciplines. FGIT 2009 was the first mega-conference that attempted to follow the above idea of hybridization in FGIT in a form of multiple events related to particular disciplines of IT, conducted by separate scientific committees, but coordinated in order to expose the most important contributions. It included the following international conferences: Advanced Software Engineering and Its Applications (ASEA), Bio-Science and Bio- Technology (BSBT), Control and Automation (CA), Database Theory and Appli- tion (DTA), Disaster Recovery and Business Continuity (DRBC; published indepe- ently), Future Generation Communication and Networking (FGCN) that was c- bined with Advanced Communication and Networking (ACN), Grid and Distributed Computing (GDC), Multimedia, Computer Graphics and Broadcasting (MulGraB), Security Technology (SecTech), Signal Processing, Image Processing and Pattern Recognition (SIP), and u- and e-Service, Science and Technology (UNESST).

Data Management is the process of planning, coordinating and controlling data resources. More often, applications need to store and search a large amount of data. Managing Data has been continuously challenged by demands from various areas and applications and has evolved in parallel with advances in hardware and computing techniques. This volume focuses on its recent advances and it is composed of five parts and a total of eighteen chapters. The first part of the book contains five contributions in the area of information retrieval and Web intelligence: a novel approach to solving index selection problem, integrated retrieval from Web of documents and data, bipolarity in database querying, deriving data summarization through ontologies, and granular computing for Web intelligence. The second part of the book contains four contributions in knowledge discovery area. Its third part contains three contributions in information integration and data security area. The remaining two parts of the book contain six contributions in the area of intelligent agents and applications of data management in medical domain.
